

Epifoliar Fungi of Singapore

D. R. REYNOLDS

University of California Herbarium
Berkeley, California USA 94720

Abstract

This article is a discussion of the known epifoliar fungi from Singapore found in several worldwide Herbaria, and those collected by the author. Fifty species in 15 genera are reviewed and annotated. An additional twenty new combinations in *Setameliola* are proposed to contain *Meliola* species with an ascocarp bearing straight setae. Critical attention is given to the species concepts in *Meliola* and *Polychaeton*.

Introduction

Ecologically, the epifoliar fungi are stratified in the tropical canopy (Reynolds, 1972; Gilbert *et al.*, 2007) with a prevalence in the understory where abundant hosts support a greater number and diversity of fungi. Environmental conditions affecting spatial distributions are sites in the dark canopy and openness.

Epifoliar fungi are specialized as nutritional guilds found only on the surface of living plants, particularly the leaves (Gilbert *et al.*, 2007). Several, principally, Ascomycete lineages that together comprise a polyphyletic group, have evolved into this habitat as four nutritional guilds: saprobes, plant parasites, fungal parasites, and lichenized species. With the exception of lichenized species, all share common adaptive morphological traits including a dark, melanoid pigmentation and reproduction by ascospores and mitospores. For the non-lichenized taxa, the habits and morphological traits are convergent plesiosynapsies that distinguish groups of fungi at lower clade levels. In contrast, lichenized fungi have acquired the epifoliar habit at higher clade levels equivalent to genus or species (Lücking, 2002). The Singapore lichenized species have been reviewed by Sipman (2003a, 2003b, 2007).

Thaung (2006) observed that one distribution pattern of epifoliar fungi is comparable with the phytogeography of the Indo-Malayan Biogeographic Realm with tropical rainforests, (mongabay.com/0102.htm). He suggested that the radiation pattern indicates an Indo-Himalayan origin with dispersal southward into SEAsia, including Singapore.

The information on currently known epifoliar fungi from Singapore is obtained from several worldwide Herbaria, and those collected by the author in Singapore in 2007. The epifoliar fungi from Singapore are historically known from the Fungi Malayana exsiccatum assembled by C.F. Baker from 1916-1920. Numbers 401- 500 of Century V were collected in Singapore out of the total 600 specimens. Twenty-two Singapore species of epifoliar ascomycetes were identified; 12 of them were described as new by Saccardo (1918). The exsiccatum specimens are currently known to be curated in Herbaria BPI, CUP, FH, PC, S and UC (Pfister, 1985; Holmgren & Holmgren, 1998). Lim (1975) published a list of 13 epifoliar species from Singapore; the cited collections are currently unavailable for reexamination.

The list of taxa is as follows –

1. ***Asteridiella*** McAlpine, Proc. Linn. Soc. New South Wales 187 (1897) 38. Ascospores 4 septate, brown; asci evanescent; ascocarp superficial, globose, glabrous; mycelium superficial, brown, septate, branched, aseptose, hyphopodia alternate.

1.1. ***Asteridiella umirayensis*** (Yates) Hansford, Sydowia 10 (1957) 51.

-*Meliola umirayensis* Yates, Philipp. Jour. Sci. Bot. 13 (1918) 370;

-*Irenia umirayensis* (Yates) Hansford, Proc. Linn. Soc. London 157 (1946) 170.

-*Irenia bakeriana* Hansford, Proc. Linn. Soc. London 157 (1946) 169.

Ascospores 4 septate, oblong to ellipsoid, 36-45 x 14-16 μm . Ascocarp scattered, to 180 μm diameter, surface cells conoid projecting to 15 μm . Mycelium to 3mm diameter, hyphopodia alternate, ampulliform.

Specimen reported: C.F. Baker Fungi Malayana 455, determined as Meliola reticulate Karsten & Roumeguère; BPI 696686-87, Flora of Singapore 5796, Coll. J.J. Chupp, 2 Jul 1920.

Illustration: Hansford, 1963.

Distribution: Java, Philippines, Singapore.

2. ***Asterina*** Lévillé, Ann. École Natl. Agric. Montpellier (1845) 59.

Ascospores brown, 1 septate, ellipsoid-oblong; Asci fissitunicate, paraphysate; Ascocarp dimidiate, circular, radiate, astomate; Mycelium brown, with hyphopodia or node cells.

2.1. *Asterina erebia* Sydow, Ann. Mycol. 25 (1927) 59, *sensu* Stevens & Ryan, Ill. Biol.

Monogr. (1939) 70. **Fig. A.**

Ascospores 26-32 x 12-16 μm . Ascus 55-65 μm . Ascocarp 150-300 μm ; hyphopodia alternate, 2-celled.

Specimens reported: Singapore, Bukit Timah Nature Reserve, Oct 2007, DRR 15, 16, 17, 18.

Distribution: Singapore.

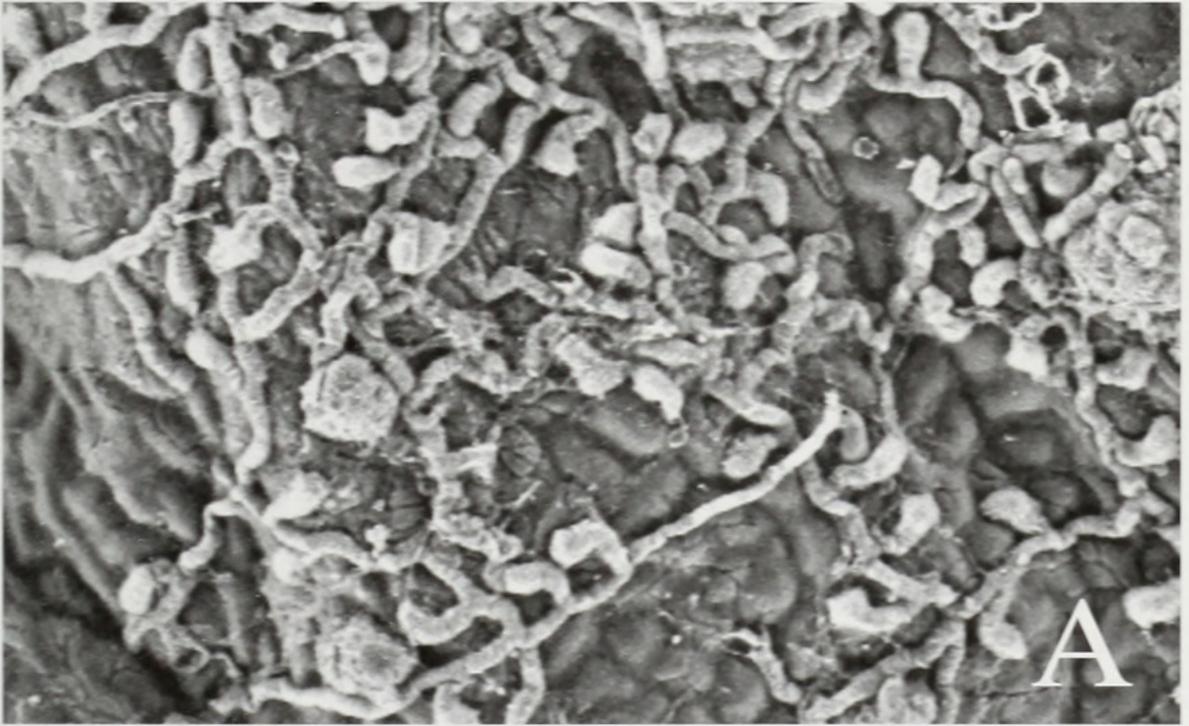

Figure A. *Asterina erebia* Sydow. Mycelium with hyphopodia and ascocarps [from DRR Singapore 16; line = 20 μm].

2.2. *Asterina singaporensis* Sydow, Ann. Mycol. 18 (1920) 159. **Fig. B.**

Ascospores 16-20 x 6-8 μm . Asci 30-40 μm . Ascocarp 80-110 μm diameter. Colonies epiphyllous, 2-5 mm diameter, hyphopodia dispersed rarely opposite, 10-15 μm long.

Specimen reported: C.F. Baker Fungi Malayana 401. Holotype at UC. Sydow and Sydow (1917) noted that this specimen was distributed as *Asterina trachycarpa* Sydow (see also Saccardo, 1918).

Distribution: Singapore.

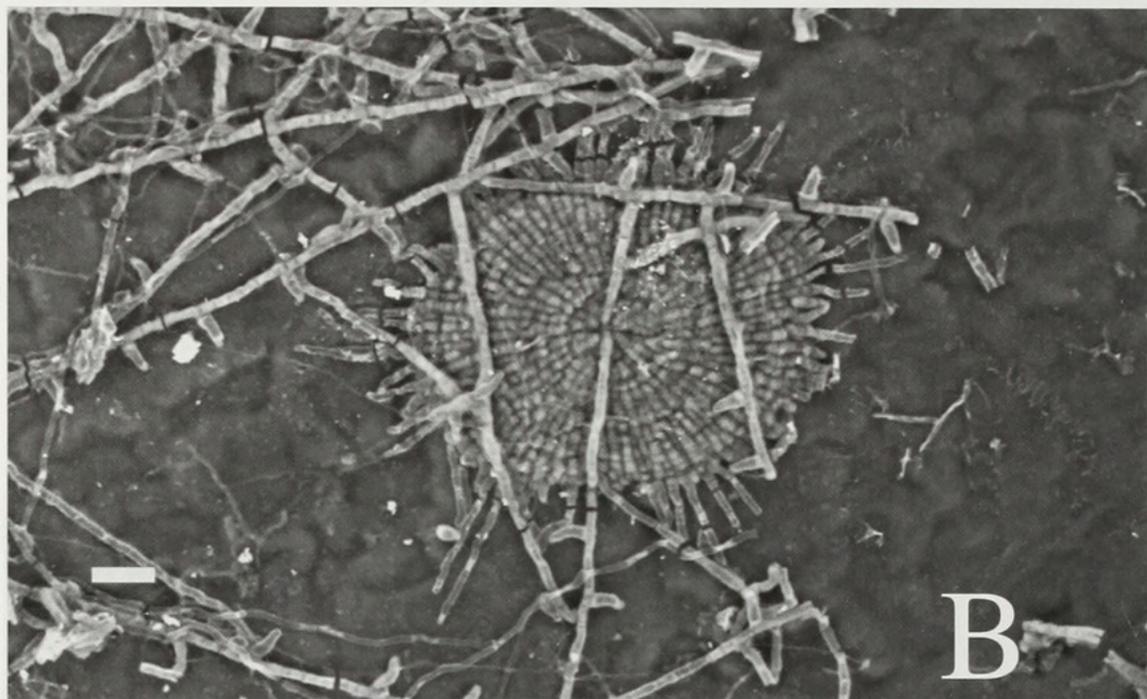

Figure B. *Asterina singaporensis* Sydow. The dimidiata ascocarp is formed beneath hyphopodate hyphae [from C.F. Baker *Fungi Malayana* 301; line = 10 μ m].

3. *Ciferriusia* Batista in Batista & Ciferri, Sydowia Beih. 3 (1962) 17.

Ascospore 3 transseptate. Asci fissitunicate, paraphysate. Ascocarp developed beneath a mycelia pellicle, without setae. Mycelium hyaline to subhyaline, septate.

3.1. *Ciferriusia orientalis* Batista & Costa in Batista & Ciferri, Sydowia Beih. 3 (1962) 17.

Ascocarp globose-depressed, with a mycelical shield, 90-180 μ m diameter, ostiolate. Asci 40-60 μ m. Ascospores clavate, 3-transversely septate, hyaline, 15-20 x 4-5 μ m.

Specimen collected: Singapore Botanical Garden, Oct 2007, DRR 4.

Illustration: Batista & Ciferri, 1962: Fig. 11.

Distribution: Philippines, Singapore.

Note: Arx and Müller (1975) considered *Ciferriusia* to be a synonym of *Yatesula* H. Sydow & P. Sydow, which has muriform ascospores.

4. *Ellisiodothis* Theissen, Ann. Mycol. 12 (1914) 73.

Ascospores hyaline, unicellular. Ascus fissitunicate, pseudoparaphysate, 45-50 x 16 μ m; Ascocarp hypostomatic, superficial, dimidiata, nonradiate, dark.

This genus is closely related to *Microdothella* Sydow and *Myiocopron* Spegazzini. It was suggested as a synonym of the latter taxon by A. Sivanesan (see Kirk, 2008).

4.1. ***Ellisiodothis grammatophylli*** (Saccardo) Sydow & Sydow, Ann. Mycol. 18 (1920) 185.

-*Microthyrium grammatophylli* Saccardo, Bull. Orto Bot. Regia Univ. Napoli 6 (1918) 49.

-*Ellisiodothis grammatophylli* Sydow, Ann. Mycol. 18 (1920) 134.

Ascospores 22 x 6 µm. Ascus 45-50 x 16 µm. Ascocarp 325-450 µm.

Specimen reported: C.F. Baker *Fungi Malayana* 467. Holotype at PAD and isotype, UC.

Distribution: Singapore.

5. ***Lembosia*** Léveillé, Ann. Sci. Nat. 3 (1845) 58.

Ascospores 1 septate, brown. Asci spherical, fissitunicate, paraphysate. Ascocarp long or linear forming, X or Y forming, with a longitudinal slit. Mycelium superficial, hyphae with lateral or intercalary hyphopodia, hypostroma or innate hyphae absent

5.1. ***Lembosia hormosiana*** Saccardo, Bull. Orto Bot. Regis Univ. Napoli 6 (1918) 52. Ascospores 17-16 x 15-6.5 µm. Ascus 35-40 x 18-20 µm. Ascocarp 235-400 x 90 µm.

Specimen reported: C.F. Baker *Fungi Malayana* 443. Holotype at PAD and isotype, UC.

Distribution: Singapore.

5.2. ***Lembosia pandani*** (Rostafinski) Theissen, Ann. Mycol. 11 (1913) 457.

-*Asterina pandani* Rostafinski, Bot. Tidsskr. 24 (1902) 361.

Ascospores 28-38 x 24-26 µm. Ascus 28-30 x 24-26µm. Ascocarp 350-850 µm.

Specimen reported: C.F. Baker *Fungi Malayana* 444. Holotype at FH and isotype, SING. *Distribution*: Philippines, Singapore.

6. ***Lembosina*** Theissen, Ann. Mycol. 11 (1913) 437.

Ascospores brown, 1-septate. Asci fissitunicate, paraphysate. Ascocarp superficial, elongated or linear, *textura radiate*, opening by a longitudinal slit.

Mycelium subcuticular or intraepidermal, crustose stroma present. Hyphae, septate, without hyphopodia, forming hypostroma between the epidermis and cuticle.

6.1. *Lembosina heptapleuri* (Saccardo) v. Arx in Arx & Müller, Studies in Mycol. 9 (1962) 123.

-*Lembosia heptapleuri* Saccardo, Bull. Orto Bot. Regis Univ. Napoli 6 (1918) 52;

-*Echidnodes heptapleuri* (Saccardo) H. Sydow & P. Sydow, Ann. Mycol. 18 (1921) 185.

Ascospores 16 x 5 µm. Ascus 40 x 12 µm. Ascocarp 300-1000 x 100-120 µm.

Specimen reported: C.F. Baker Fungi Malayana 442, as Lembosia heptapleuri.
Holotype at PAD and isotype, UC.

Distribution: Singapore.

7. *Meliola* Fries emend. Mibey & Hawksworth, Mycol. Pap. 174 (1997) 23.

-*Amphitrichum* Nees ex Sprenger, Pl. Crypt. Trop. (1820) 46 *pro parte sensu* Hansford (1961).

-*Asteridium* Saccardo, Syll. Fung. 1 (1882) 49.

-*Courturaea* Castagne In Fries, Summ. Veg. Scandl. (1846) 407.

-*Meliola* Fries emend. Bornet, Ann. Sci. Nat III: 16 (1851) 267.

-*Meliola* Fries, Syst. Orb. Veg. (1825) 111.

-*Mycothecium* Kunze ex Fries, Syst. Mycol. 3 (1829) 232.

-*Sphaeria* Fries, Syst. Orb. Veg. (1823) 513, *pro parte sensu* Hansford (1961).

Ascospores darkly pigmented, 3-4 transseptate; Ascus unitunicate, uniformly thin-walled; Ascocarp globose, glabrous. Mycelium superficial, comprised of darkly pigmented, septate, setose hyphae; capitate hyphopodia alternate or unilateral, opposite or mixed opposite and alternate. Asexual reproduction, when present, by single phialides producing unicellular, hyaline mitospores.

Meliola was first described by Fries (1825) with a single species and currently includes 2957 taxa (Kirk, 2008). The genus was one of five genera recognized in the Meliolineae by Hansford (1961). This lineage was recognized as the Meliolaceae by Dennis (1968, 1970), Stevens (1927, 1928), and Stevenson (1975), and Meliolales by Alexopoulos *et al.* (1996) and Müller and Arx (1973). Luttrell (1989) placed *Meliola* in the Meliolales of the Pyrenomycetes, which was sustained in a phylogeny discovered by Saenz and Taylor (1999).

A careful and detailed monographic study of 1814 taxa in the genus was undertaken by Hansford (1961). Nonetheless, a more than double

proliferation of names has been inadvertently manifested with Hansford's unaccountable arrangement of the species according to the families of the host plants on which they occurred. Subsequent new taxa have been described because of the compartmentalization introduced with the associated vascular plant family as a plesiomorphic character. A comparison of species descriptions that disregards this character demonstrates the taxonomic redundancy. This artificial classification is underscored in the Hansford (1961) monograph by some species listed as occurring on members of more than one vascular plant family and by the recognition of species in which the host is unknown. The Hansford (1961) approach also implies a co-evolution of *Meliola* with angiosperms at the family level, which is not supported by distribution patterns on a phylogenetic clade for the latter.

The consequence of Hansford's *Meliola* species concept is a high potential for a redescription of the same fungus several times. An example is the excessive number of proliferation of uncritically described species by subsequent workers (Hosagoudar 1994, 1996, 2000; Hosagoudar *et al.*, 1997; Hosagoudar and Agarwal, 2008; Hu, 1996, 1999; and Mibey and Hawksworth 1997; Rodriguez 2006). This report does not recognize the associated vascular plant host as a plesiomorphic character.

The species concept of *Meliola* recognized here does not recognize the associated vascular plant host as a plesiomorphic character, although the host range appears to be limited for some clades (Stevens, 1926; Ciferri, 1954; Rodriguez, 2001). The consequence is a description of the same fungus several times because of the host affiliation.

A useful device for an assessment of a *Meliola* species was introduced by Beeli (1920). A numerical code was derived from a set of eight character states with from 3 to 6 variables. The Beeli Formula was revised by Stevens (1927, 1928), Hansford (1961) and Farr (1971). Some authors (Mibey and Hawksworth, 1977) criticize the Beeli Formula as not representing all features and thus was said to be diagnostically lacking. The occurrence of the same Beeli Formula for a group of species was dismissed as insignificant because of the supposed value of other features that would purportedly separate species. These include finite distinctions such as small variations in ascospore size and hyphal or hyphopodial cell size. Most of the features they (Mibey and Hawksworth, 1977) would utilize in the species concept for critical separation of taxa are highly variable and thus unreliable in species recognition, except as a promulgation.

I believe that Beeli recognized the core characters that comprise a species concept for *Meliola*. The continuous character delimitations reflect natural size ranges. Furthermore I regard all putative taxa with a similar Beeli Formula to represent the same or a group of closely related species. Phylogenetically, a large number of overlapping names have been proposed

for the termini of a monophyletic lineage with morphological expression better represented by the Beeli Formula than the minutial variations of these same characters as exemplified by Mibey and Hawksworth (1997).

This predominately tropical genus first appeared in the fossil record in the Eocene (Dilcher, 1965), at a time in the Cretaceous when associated angiosperm hosts were diversifying from a Triassic origin (Taylor *et al.*, 2009). The fossilized, melanoid ascocarp walls of this taxon and other foliicolous ascomycetes are well preserved on compressed leaf cuticles. A lineage older than the Eocene is suggested by the remarkable similarity of specimens to extant species, although the centrum was rarely preserved.

7.1. *Meliola aethiops* Saccardo, Bull. Orto Bot. Regis Univ. Napoli 6 (1918) 41.

-*Meliola aglaina* Hansford, Sydowia 9, (1955) 59.

-*Meliola ekebergiae* Hansford, J. Linn. Soc. Bot. 51 (1937) 274.

-*Meliola kauaiensis* Stevens, Bernice P. Bishop Mus. Bull. 19 (1925) 39.

-*Meliola mataybae* Stevens, Ann. Mycol. 26 (1928) 228;

-*Meliola capensis* (Klatchbrenner & Curtis) Theissen var *mataybae* (Stevens) Hansford,
Sydowia Beih. 2 (1961) 447.

-*Meliola nicaraguensis* Spegazzini, Bol. Acad. Nac. Cien. Córdoba 26 (1926) 378.

-*Meliola opposite* Sydow var *africana* Hansford, Sydowia Beih. 2 (1961) 411.

Ascospore 32-45 × 11 μm. Ascocarp to 180 μm diameter. Mycelium to 3 mm diameter;

capitate hyphodia opposite or alternate, ampulliform; mycelial setae grouped around ascocarp, straight, simple, 280 μm.

Beeli Formula: 31123221

Specimen reported: C.F. Baker *Fungi Malayana* 449, determined as *Meliola aethiops*. Holotype at SING (#33777). A Singapore specimen was cited as *Meliola aethiops* by Lim (1975).

Illustration: Hansford, 1963.

Distribution: Philippines, Singapore.

7.2. *Meliola citricola* Sydow, Ann. Mycol. 15 (1917) 183.

[IMI Descriptions of Fungi and Bacteria 2006, 168, Sheet 1672].

- Meliola bussei* Mibey in Mibey & Hawksworth, Mycol. Pap. 174 (1997) 32.
 - Meliola khayae* Hansford var *minor* Hansford & Deighton Mycol. Pap. 23 (1948) 43.
 - Meliola ostryodemidis* Hansford & Deighton. Mycol. 3 (1948) 34.
 - Meliola ostryodemidis* Hansford & Deighton var *leptoderridis* Hansford & Deighton 1948. Mycol. Pap. 23 (1948) 35.
 - Meliola stizobii* Hansford & Deighton var *desmodii-salicifolii* Hansford & Deighton, Mycol. Pap. CMI 23 (1948) 31.
- Ascospores 30-48 μm \times 9-19 μm . Ascocarp to 140-170 μm diameter. Mycelium to 5 mm diameter; capitate hyphopodia alternate, opposite, straight to antrorse. Mycelial setae scattered or grouped around ascocarp, 160-800 μm . *Briantia* phialides (Reynolds, 1989b) sometimes present.

Beeli Formula: 31334223

Specimens reported: Hansford (1961) cites a Singapore collection, *Chupp* 5949, which is curated in SING as #38557 and #96896; they are determined as *Meliola*. An addition specimen, *Baker* 1627, is also cited (Type: Herb. PBS 23747).

Illustrations: Stevens, 1928; Hansford, 1963; Lim, 1975; Hosgoudar & Agarwal, 2008.

Distribution: Borneo, Philippines, Singapore, Sumatra, Taiwan.

7.3. *Meliola cylindropoda* Doidge, Trans. Roy. Soc. South Africa 8 (1920) 138.

- Irenina mangostana* (Saccardo) Stevens, Ann. Mycol. 25 (1927) 457.
- Meliola araliicola* Yamamoto, Trans. Nat. Hist. Soc. Formosa 31 (1941) 224.
- Meliola euchrestiae* Yamamoto, Trans. Nat. Hist. Soc. Formosa 31 (1941) 226.
- Meliola eugeniae-jamboloidis* Hansford var *paulensis* Hansford, Sydowia 9 (1955) 62.
- Meliola garcinae* Yates var *mangostana* (Saccardo) Hansford, Proc. Linn. Soc. London 160 (1948) 120.
- Meliola littoralis* Sydow, Bothalia 2 (1928) 462.
- Meliola mangostana* Saccardo, Bull. Ort. Bot. Napoli 6 (1921) 42.
- Meliola plumbaginis* Hansford & Stevens, J. Linnean Soc. London 51 (1937) 280.
- Meliola teclae* Hansford var *toddaliae-asiaticae* Hansford, Proc. Linn. Soc. London 153 (1941) 11.

Ascospores 38-44 μm \times 15-17 μm . Ascocarp to 240 μm diameter. Mycelium to 6 mm diameter, capitate hyphopodia alternate, straight or bent. Mycelial setae scattered, to 1110 μm .

Beeli Formula: 31114233

Specimen reported: C.F. Baker *Fungi Malayana* 453. This is the type specimen for *M. mangostana* (Herb. SING 33779).

Illustration: Hansford, 1963.

Distribution: Philippines, Singapore, Taiwan.

7.4. *Meliola fagraeae* Sydow & P. Sydow, Ann. Mycol. 12 (1914) 549.

-*Meliola mannavanensis* Hosagoudar, C.K. Biju, Baram & Crane. Mycotaxon 76 (2000) 302.

-*Meliola rajamalaensis* Hosagoudar, C. K. Biju & Abraham. Nova Hedwigia 80 (2005) 493.

Ascospores 41-55 μm \times 15-19 μm . Ascocarp to 225 μm diameter. Mycelium to 3mm diameter, capitate hyphopodia alternate, straight. Mycelial setae numerous, scattered, straight or flexuous, to 360 μm .

Beeli Formula: 31215232

Specimen reported: BO 5354, reported in Hansford 1961:525.

Illustration: Hansford, 1963.

Distribution: Philippines, Singapore, Sumatra

7.5. *Meliola garciniae* Yates, Philipp. Journ. Sci. Bot. 13 (1918) 369.

-*Meliola dognyensis* Huguenin, Rev. Mycol. 34 (1969) 52.

-*Meliola kisubiensis* Hansford, var. *peleicola* Hansford, Sydowia 9 (1955) 43.

-*Meliola kydia* Saccardo Bull. Orto Bot. Regis Univ. Napoli 6 (1918) 13.

-*Meliola mauritiana* Hansford, Sydowia 9 (1955) 20.

-*Meliola megalochaeta* Sydow, Philipp. Journ. Sci. 21 (1932) 135.

-*Meliola teke* Hansford, Proc. Linnean Soc. Lond. 157 (1946) 180.

Ascospores 41-59 \times 15-25 μm . Ascocarp 180-360 μm diameter. Mycelium (3) 5-10 mm diameter; capitate hyphopodia opposite or alternate; mycelial setae simple, entire, acute to obtuse or dentate, 325-1600 μm .

Beeli Formula: 31115334

Specimen reported: C.F. Baker Fungi Malayana 450, determined as Meliola kydia. Holotype at PAD and isotype, UC.

Illustration: Hansford, 1963.

Distribution: Amboina, Borneo, Java, Philippines, Singapore, Vietnam.

7.6. *Meliola heterodonta* Sydow, Ann. Mycol. 14 (1916) 357.

-*Meliola columbiensis* Hansford, Sydowia 9 (1955) 61.

-*Meliola justiciae* Hansford, Journ. Linn. Soc. Lond. 31 (1938) 541.

-*Meliola micropoda* Hansford, Proc. Linn. Soc. Lond. 121 (1946) 121.

-*Meliola millettiae-chrosyphillae* Deighton, Sydowia 7 (1951) 7.

-*Meliola nephelii* Saccardo, Bull. Orto Bot. Regis Univ. Napoli 6 (1918) 42.

-*Meliola newbouldiae* Hansford & Deighton, Mycol. Pap. 23 (1948) 66.

-*Meliola oncinotidis* Doidge, Bothalia 4 (1948) 851.

-*Meliola securidacae* Hansford, Sydowia 10 (1957) 88.

-*Meliola securidacicola* Hansford, The Meliolineae, a monograph. Sydowia Beih. 2 (1961) 82.

-*Meliola stizolobii* Hansford & Deighton, Mycol. Pap. 23 (1948) 31.

-*Meliola tounatae* Stevens, Ann. Mycol. 26 (1948) 204.

Ascospores 28-40 x 11-24 μm . Ascocarp to 190 μm ; Mycelium 8 mm diameter; mycelia setae simple, entire, acute to obtuse, or dentate, scattered or grouped around perithecium, to 960 μm ; capitate hyphopodia opposite or alternate, subanthrose to straight. *Hughesia* phialides sometimes present.

Beeli Formula: 31133223.

Specimens reported: Baker Fungi Malayana 252 (holotype, PBS 4031); also Baker Fungi Malayana 454 (holotype of Meliola nephelii, SING 33781).

Illustrations: Hansford, 1963; Hosagoudar & Agarwal, 2008.

Distribution: Java, Philippines, Singapore.

7.7. *Meliola inocarpi* Stevens, Ann. Mycol. 26 (1928) 232.

Ascospore 43-52 x 17-20 μm . Ascocarp 190 μm diameter. Mycelium 2-8 mm diameter, setae to 900 μm ; capitate hyphopodia opposite to alternate, straight or bent.

Beeli Formula: 31124323

Specimen reported: C.F. Baker Fungi Malayana 459, determined as Meliola sp. Holotype at ILL, and isotype, UC.

Illustration: Hansford, 1963. Distribution: Singapore

7.8. ***Meliola litseae*** Sydow, Ann. Mycol. 15 (1917) 366.

-*Meliola golaensis* Deighton, Sydowia 11 (1958) 105.

-*Meliola litseae* Yates, Philip. Journal Sci. C. Botany 12 (1918) 366.

-*Meliola micheliae* Hansford, Proc. Linn. Soc. London 158 (1947) 34.

-*Meliola singaporensis* Hansford, Proceedings of the Linnean Society, London 157 (1946) 17.

Ascospores 4 septate, 42-60 × 16-25 µm. Ascocarp to 225 µm. Mycelium amphigenous, thin to velvety, 1 to 7 mm diam. Hyphae substraight to undulate or flexuous, capitate hyphopodia alternate, antrorse to ampulliform, mycelia setae scattered or grouped around ascocarp, entire, obtuse or dentate, 600-1000 µm.

Beeli Formula: 31114323

Specimens reported: C.F. Baker Fungi Malayana 457, determined as Meliola sp. C.F. Baker Fungi Malayana 480, type of M. singaporensis (holotype, SING).

Illustrations: Hansford, 1963; Hosagoudar & Agarwal, 2008.

Distribution: Philippines, Singapore, Taiwan.

7.9. ***Meliola mangiferae*** Earle, Bull. New York Bot. Gard. 3 (1905) 307.

-*Meliola helicae* Yamamoto, Trans. Nat. Hist. Soc. Formosa 31 (1941) 54.

-*Meliola naisophyllae* Hansford & Deighton, Mycol. Paper IMI 23 (1948) 13.

-*Meliola palmicola* Winter var *coperniciae* Spegazzini, Anal. Mus. Nac. Buenos Aires 32 (1924) 384.

-*Meliola zamboangensis* Hansford, Sydowia Beih. 1 (1957) 119.

-*Sphaeria trichostroma* Kunze in Weigelt's Exsiccatum (1827). (see Pfister, Mycotaxon 23: (1985) 1-139.

Ascospores $33-48 \times 11-21 \mu\text{m}$. Ascocarp 140-200 μm diameter. Mycelium to 15 mm; mycelial setae scattered or grouped around ascocarp, simple, sometimes dentate, 270-600 μm ; capitate hyphodia alternate.

Beeli Formula: 31114222

Specimen reported: A specimen of *A. Chupp 5948* (SING 38558) at K is cited by Hansford (1961) from Singapore. Holotype at S.

Illustrations: Hansford, 1963; Housgoudar & Agarwal, 2008.

Distribution: Borneo, Burma, Malaya, Philippines, Singapore, Taiwan.

7.12. *Meliola* sp.

Specimen reported: C.F. Baker Fungi Malayana 458. UC, BPI 692188-89.

Distribution: Singapore

Note: The Baker collection is not a *Meliola*; the material appears to be sterile.

8. *Meliolina* H. Sydow & P. Sydow, Ann. Mycol. 12 (1914) 553.

Ascospores 3-septate, constricted, darkly pigmented, often with thin-walled pale bands. Ascus extenditunicate, paraphyses evanescent. Ascocarp superficial on external mycelium, globose, glabrous, astomatic, often setose. Mycelium brown, superficial, exhyphopodiate, forming stomopodia, setose, furcated.

8.1. *Meliolina malacensis* (Saccardo) Trotter in Saccardo, Sylloge Fungorum 24 (1926) 360.

-*Meliola malacensis* Saccardo, Bull. Orto Bot. Regia Univ. Napoli 6 (1918) 43.

Ascospores with midconstriction, $35-45 \times 12-15 \mu\text{m}$. Ascus oblong-clavate, 80-90 μm . Ascocarp 250-300 μm ; setae simple, acute, $300-350 \times 5-5.5 \mu\text{m}$. The associated mitosporic state, *Briana* (Reynolds, 1989), was not found.

Specimen reported: C.F. Baker Fungi Malayana 451, determined as *Meliolina malacensis* Saccardo.

Distribution: Singapore

Note: This taxon was recognized by Hansford (1961) as a *Meliolina* and excluded from *Meliola*. This species was not accepted in the treatment of *Meliolina* by Hughes (1993). *Meliola* and *Meliolina* are morphologically different as well as distant in phylogeny. These two members of the Pezizomycotina were phylogenetically inferred by Saenz and Taylor (1999) to be on separate clades. *Meliola* is a taxon in the Sordariomycetes, Meliomycetidae, Meliolales with a unitunicate ascus, as predicted by Luttrell (1989), and *Meliolina* is in the Dothidiomycetes, Dothidomycetidae, with an extenditunicate modification of the fissitunicate ascus (Reynolds, 1989a).

8.2. *Meliolina cladotricha* (Léveillé) H. Sydow & P. Sydow, Ann. Mycol. 17 (1914) 553h.

-*Meliola octospora* Cooke, Grevillea 11 (1882) 71.

-*Meliolina octospora* (Cooke) Höhnel, Akad.Wiss. Wien, Sitzungsber., Math.-Naturwiss. Kl. Abt. 118 (1909) 813.

-*Meliolina octospora* Höhnel, Akad.Wiss. Wien Sitzungsber. Math.-Naturwiss. Kl. Abt 1. 128 (1919) 557.

Ascospores with hyaline band in terminal cells near septum, 45-57 × 17-20 µm. Ascus with abundant paraphyses, 100-120 µm. Ascocarp spherical, 400µm diameter, setae 145-186 µm.

Specimen reported: A Flora of Singapore collection (SING 96897) made by an unknown collector in 1899 was labeled as *Meliola octospora* Cooke. There are no spores.

Note: Hughes (1993) argues for the acceptance of *M. octospora* Höhnel based on his interpretation of Höhnel's (1909, 1919) observations and supposed prior misuse by Stevens (1927), Hansford (1954), Yamamoto (1957) and Sivanesan (1984). We find Hughes' argument to be suspicious in that the attempt to affirm the observations of von Höhnel was based on his inadequate material now curated in Herbarium FH and assumptions made from the observations of Yamamoto (1957) from Taiwan, but without surviving specimens.

9. *Micropeltella* Montagne, Ann. Sci. Nat. Bot., sér 2, 17 (1842) 325.

Ascospores hyaline, 2-8 septate, clavate. Asci clavate, cylindrical, fissitunicate, paraphysate. Ascocarp orbicular, dimidiate-scutulate, margin pelluculoae, blue to green-black, textura meandriforme, plechymatous; ostiole distinct, round. Mycelium absent at ascocarp maturity.

Batista (1959) noted that the species of this taxon were removed from *Micropeltis* because of a lack of paraphyses, based on the examination of Singapore specimens cited here. The type specimen is Montagne 1134, Herb. P.

9.1 *Micropeltella marginata* (Montagne) Batista, Inst. Micol. Univ. Recife Publicação 56 (1959) 160.

-*Micropeltella albo-marginata* (Spegazzini) Batista, Inst. Micol. Univ. Recife Publicação 56 (1959) 153; -*Micropeltis albo-marginata* Spegazzini, Bol. Acad. Nac. Ci. Argent. 11 (1889) 572.

-*Micropeltis orchidearum* P. Hennings In: A. Engler & K. Prantl, Die natürlichen Pflanzenfamilien 23 (1897) 286.

Ascospore 87-125 × 12-15 µm. Ascus fissitunicate. Ascocarp dimidiate, plectenchymatic, blue-black, ostiolate, orbicular, 535-700 µm diameter.

Specimens reported: C.F. Baker *Fungi Malayana* 460; see also SING 36128, 36129. C.F. Baker

Malayana #460 is determined as *Micropeltis marginata* Montagne

Illustration: Batista, 1959: 88, Fig. 18.

Distribution: Singapore.

10. *Micropeltis* Montagne Ann. Sci. Nat. Bot. sér 2, 17 (1842) 122.

Ascus paraphysate, fissitunicate. Ascospores hyaline, 2-many septate, clavate, oblong to cylindrical. Ascocarp dimidiate-scutate, parenchymatic, circular, ostiolate, green-black. Mycelium absent.

10.1. *Micropeltis trimera* Saccardo, Bull. Orto Bot. Regis Univ. Napoli 6 (1918) 51.

Ascospores fusoid, 2-3 septate, 35 × 8 µm. Ascocarp margin pelliculose, black, 510-610 µm diameter.

Specimen reported: C.F. Baker *Fungi Malayana* 461, holotype in BP and isotype, UC. The UC specimen has an ascocarp measuring 350-421 µm in diameter; the immature asci measured 100 µm in length; the ascospores are immature.

Illustration: Batista 1959: 146, Fig. 60.

Distribution: Singapore.

11. ***Polychaeton*** (Persoon) Lévillé

-*Fumago* [subgenus] *Polychaeton* Persoon, *Mycologica europea*. Sectio prima. Erlangae (1822)

-*Morfea* Roze Bull. Soc. Bot. France 14: (1868) 15.

-*Morfea* (G. Arnaud) Ciferri & Batista (1963) 140.

-Subgenus *Morfea* G. Arnaud (1913) 280.

Lectotype: *Polychaeton quercinum* (Persoon) O. Kuntze (1891) = *Fumago quercina* Persoon, *Mycologica europea*. Sectio prima. Erlangae (1822). Type: Herb. L.

Mitospores formed in an expanded basal or midway centrum within a wide stalk. Stalk single, or branched with a columnate extension with a fringed ostiole. Mitospores unicellular, hyaline.

11.1. ***Polychaeton artocarpi*** (Batista, Nascimento & Ciferri) Khodap, Rostaniha 7 (2006) 79.

-*Microxiphium artocarpi* Batista, Nascimento & Ciferri in Batista & Ciferri, *Quaderno* 31 (1963) 114.

-*Microxiphium footi* (Berkeley & Desmazières) Spegazzini 1918.

-*Microxiphium jafarnizamie* Manocharachar (1979) *Nova Hedwigia* 63:185.

-*Microxiphium jambosae* Batista apud Batista & Ciferri, *Quaderno* 31 (1963) 132.

-*Microxiphium leptospermi* Fisher, *Proc. Royal Soc. Victoria, N.S.W.* 45 (1963) 191.

-*Microxiphium obtusulum* Saccardo *Phil. J. Sci.* (1921) 19: 602.

-*Microxiphium secundum* Batista & Ciferri, *Quaderno* 31 (1963) 136.

Mitospores measuring 2 x 5 µm.

Note: Lim (1975) listed three Singapore collections of *Microxiphium artocarpi*, *M. leptospermi*, and *M. secundum*.

11.2. ***Polychaeton brasiliense*** (Batista in Batista & Ciferri), *comb. nov.*

Basionym: *Microxiphium brasiliense* Batista in Batista & Ciferri, *Quaderno* 31 (1963) 119.

-*Microxiphium alanqii* Agarwal & Sharma, *J. Indian Bot. Soc.* 53(1-2) (1974) 77.

-*Microxiphium ciliolatum* (Saccardo) Ciferri & Batista apud Batista &

Ciferri, Quaderno 31 (1963) 121.

-*Microxiphium coffeanum* Batista & Matta, Quaderno 31 (1963) 122.

-*Microxiphium inspersum* Batista & Ciferri, Quaderno 31 (1963) 132.

-*Microxiphium spathodeae* Batista & Matta apud Batista & Ciferri, Quaderno 31 (1963) 137.

-*Microxiphium unedonis* (Marie & Saccardo) Batista & Ciferri, Quaderno 31 (1963) 139.

-*Polychaeton bassiae* Manocharachary, Kunwar, Sarath & Nagamani in Manocharachary, Kunwar, Babu & Nagamani. 2003.

Mitospores measuring $2 \times 3.5 \mu\text{m}$.

Note: Lim (1975) listed two Singapore collections of *Microxiphium coffeanum* and *M. spathodeae*.

11.3. *Polychaeton tenellum* (Saccardo), *comb. nov.*

Basionym: *Microxiphium tenellum* Saccardo, Bull. dell'orto Bot. della R. Univ. Napoli 24 (1918) 5.

-*Microxiphium aciculiforme* Ciferri, Batista & Nascimento in Batista & Ciferri, Quaderno 31 (1963) 110.

-*Microxiphium atmosphaericum* Batista, Bezerra & Garnier in Batista & Ciferri, Quaderno 31 (1963) 117.

-*Microxiphium columnatum* Batista, Ciferri & Nascimento in Batista & Ciferri, Quaderno 31 (1963) 123.

-*Microxiphium cylindricum* Batista & Ciferri, Quaderno 31 (1963) 127.

-*Microxiphium dubium* Saccardo, Ann. Mycol. 13 (1915) 127.

-*Microxiphium philippinensis* Ciferri & Batista in Batista & Ciferri, Quaderno 31 (1963) 135.

-*Microxiphium viride* Batista & Ciferri, Quaderno 31 (1963) 141.

-*Polychaeton pinicola* Batista, Nascimento & Ciferri apud Batista & Ciferri, Quaderno 31 (1963) 135.

-*Polychaeton purpuraefaciens* (J.F.H. Beyma) Reynolds & Gilbert, Aust. Syst. Bot. 18(3) (2005) 275.

Mitospores measuring $1.5 \times 5 \mu\text{m}$.

Specimens reported: C.F. Baker Fungi Malayana 468, holotype at BP; isotype, UC; Singapore, Bukit Timah Reserve, Oct 2007, DRR Singapore 20 (SING, UC). Lim (1975) also listed two Singapore collections of this species as *Microxiphium aciculiforme*, *M. columnatum*.

Illustrations: Beyma, 1931; Batista & Ciferri, 1963; Ciferri *et al.*, 1956.

Distribution: Indonesia, Philippines, Singapore, Taiwan, Thailand, Vietnam.

Note: Forty six species have been described as *Microxiphium* (= *Microxyphium*) (Harvey) ex Berkeley & Desmazières in Thümen (1879). Most of these are synonyms of *Polychaeton*.

Yamamoto (1955) noted a “*Microxyphium* (*Ceratopycnidium*) type” in the “imperfect stage,” described as, “A peridium is semispherical...” Reynolds and Gilbert (2005) found that *Microxiphium* is based on two mitosporic forms. The mycelium forms a setose pellicle and mitosporic reproduction is twofold: 1. a rosette of hialidic cells found in the mycelium or as a cortex of hyphae surrounding the mycelia setae (*Microxiphium*); 2. subpellicular areas producing triradiate, septate mitospores (*Bisbyopeltis phoebesii*).”

The pycnidium of *Microxiphium sensu* Batista & Ciferri (1963b) is the source of a few characters that are used to distinguish 28 taxa. It is described as cylindrical. A fimbriated appearance is given to the apex by hyaline hyphal extensions beyond the darkly pigmented cells forming the apical dispersal column. The taxa recognized range in a continuous progression from an attenuated form to one with a somewhat attenuated lower area that continues as an extended neck formed around a canal through which the mitospores are dispersed from the basal conidiogenous centrum. A continuum of character variability can be found in an examination of the types and other collections of *Microxiphium* spp. in Herbarium URM and in pure culture isolates derived from a single mitospore (unpublished research).

Polychaeton forms a mitosporic centrum within a wide stalk, located from the central to the upper part. *Conidioxyphium* Batista and Ciferri was found to be indistinguishable microscopically (Singh *et al.*, 2006) with cluster analysis, principal components analysis, and discriminate analysis (Faull *et al.*, 2002). Arnaud (1913) considered these structures to be spermagonia. Beyma (1931) gives details of development in culture. The conidiogenous hyphae of the centrum are sympodially branched, forming phialides with collarettes. The stalks may be single or branched; the branching often arises from mitospores germinating directly on the stalk. A columnate extension beyond the centrum often has a fringed ostiole. The mitospores are unicellular and hyaline. Observations (Reynolds, 1978) made on the mitosporic structures of *Scorias spongiosa* and collections from tropical climates indicate that the pycnidia of *Polychaeton* are variable in length and branching patterns. The fruit body stalk that subtends the mitosporic centrum is characteristically as wide as the centrum. The mitospore morphology is stable and produced within an internal pycnidial centrum. The hyaline, unicellular spore is exuded from the centrum along a canal

in a columnate neck. A droplet of water soluble matrix contain multiple conidia forms under humid conditions. The mitospores flow down the fruit body onto a substrate; dilution of the spore containing drop initiates germination. Typically the mitospore divides to form a hyphal initial and the melanoid pigmentation accumulates in the cell walls. Measurements of the mitospores as they are exuded from the apex of the fruit body comprise primary taxonomic characters.

The name *Morfea* has been utilized for both a concept of mitosporic and ascosporic monomorphic and pleomorphic species by Roze (1868) and Batista and Ciferri, (1963a). The name was clarified as a mitosporic nomen and affirmed as *Polychaeton* (Hughes, 1976; Punithalingam, 1981; Reynolds, 1998).

12. *Schizothyrium* Desmazières, Ann. Sci. Nat. Bot. sér 3, Bot. 11 (1840) 360.

Ascospores 1-septate, hyaline; Ascus extenditunicate; ascocarp dimidiate, dark, with radial margin; Mycelium inconspicuous.

12.1. *Schizothyrium longispora* (Patouillard) Arx, in Müller & Arx, Die Gattungen der didymosporen Pyrenomycetes (1962) 202.

-*Dictyopeltis lucumae* Batista, Anais IV. Congresso Nac. Soc. Bot. Brazil (1953) 117.

-*Eremotheca philippensis* Sydow, Ann. Mycol. 15 (1917) 235,

-*Microthyriella enaequalis* Batista, Mycopath. Mycol. Appl. 5 (1951) 171.

-*Microthyriella guianensis* Stevens & Manter, Bot. Gaz. 79 (1925) 290.

-*Microthyriella macrospora* Höhnelt, Akad. Wiss. Wien, Sitzungsber. Math.-Naturwiss. Kl. Abt. I, Biologie 127 (1918) 630.

-*Microthyrium browneanum* Saccardo, Bull. Orto Bot. Regis Univ. Napoli 6 (1918) 50.

-*Microthyrium lomgisporum* Patouillard, Bull. Soc. Mycol. France 20 (1888) 118.

Ascospores 35-60 × 12-17 µm. Asci 60-75 × 40-50 µm. Ascocarp superficial, roundish, 400-1200 µm diameter, dark brown.

Specimen reported: C.F. Baker Fungi Malayana 465. Holotype at UC.

Distribution: Singapore.

13. *Setameliola*, gen. nov

= *Meliola sensu* Mibey & Hawksworth (1997)

Sporidia 3-4, septata, fusca. Asci con 2-4 spori, aparaphysati. Ascocarp in

mycelio maculiformi superficiali, globosa, astoma, setosus. Mycelium ex hyphis brunneis, septatis vel hyphis formans catillus, cum hyphopodia, setosus.
 - Typus species: *Setameliola argentina* (Spegazzini) D.R.Reynolds

Diagnosis: This taxon is distinguished by the presence of setae on the perithecium as well as the mycelium. *Meliola* Fries emended Bornet (1851) *sensu* Hansford (1961) includes species that have glabrous as well as setose ascocarp. The Mibey and Hawksworth (1997) *Meliola* emendment provides for a perithecium "devoid of setae or appendages." Accordingly, *Setameliola* includes the 23 species of *Meliola sensu lato* with setose ascocarp. The mycelial setum is the character distinction of *Meliola* and *Setameliola* from *Irenopsis* (setose ascocarp), *Appendiculella* (laviform ascocarp appendages) and *Asteridiella* (glabrous ascocarp). Two of the 24 species of *Setameliola* (*S. araucariae* and *S. agathidis*) form unusual thalloid plates (Ellis, 1974; Hansford, 1961; Katumoto & Hosagoudar, 1989).

13.1 *Setameliola argentina* (Spegazzini), *comb. nov.*

Basionym: *Meliola argentina* Spegazzini, Ann. Soc. Cient. Argentina 9 (1880) 177. [Holotype: Spegazzini 510, S].

-*Irenopsis martiniana* (Gaillard) Stevens, Ann. Mycol. 25 (1927) 437

-*Meliola argentina* Spegazzini var *hawaiiensis* Hansford, Sydowia 11 (1958) 51.

-*Meliola argentina* Spegazzini var *africana* Hansford, Sydowia 9 (1955) 9.

-*Meliola argentina* Spegazzini var *leeuwenii* Hansford, Sydowia 10 (1957) 63.

Type: BO 5607.

-*Meliola circinans* Earle, Bull. New York Bot. Gard. 3 (1905) 304.

-*Meliola circinans* Earle var *rhynchosporae* Hansford (1904) 304.

-*Meliola intricata* Sydow, Philipp. Journ. Sci. Bot. (1913) 268. Type: PBS 7152

-*Meliola juddiana* Stevens, Bernice B. Bishop Mus. Bull. 19 (1925) 32.

-*Meliola martiniana* Gaillard, Le Genre *Meliola* (1892) 68.

-*Meliola setulifera* (Spegazzini) Stevens, Ann. Mycol. 25 (1927) 285. Type: Rabenhorst and Winter. *Fungi Europaei et Extraeuropaei* 3852 (Herb. F).

Ascospores oblong, obtuse, 4-septate, 37-47 x 15-18 μm . Ascocarp to 190 μm diameter, with setae straight to acute, 90 x 8 μm . Mycelium epiphyllous, dense, velvety; hyphae sub-straight to undulate, branching opposite; capitate hyphopodia alternate to opposite, head cell straight or bent, stalk cell cuneate; mycelial setae, simple with acute apex, entire, 400 μm length.

Illustrations: Hansford, 1963; Stevens, 1928: 381, Plate IV-40.

Distribution: Borneo, Philippines, Singapore, Taiwan

The following recombinations are made on the basis of the setose ascocarp:

13.2. *Setmeliola agathidis* (Ellis), *comb. nov.*

Basionym: *Meliola agathidis* Ellis, Trans. Brit. Mycol. Soc. 63 (1974) 96. Type: IMI 73853.

13.3. *Setmeliola apiculata* (Hansford), *comb. nov.*

Basionym: *Meliola apiculata* Hansford, Proc. Linn. Soc. London 160 (1948) 137. Type: Herb. ILL.

13.4. *Setmeliola araucariae* (Ellis), *comb. nov.*

Basionym: *Meliola araucariae* Ellis, Trans. Brit. Mycol. Soc. (1974) 93. Type: IMI 170578.

13.5. *Setmeliola artocarpiicola* (Stevens ex Hansford), *comb. nov.*

Basionym: *Meliola artocarpiicola* Stevens ex Hansford, Sydowia Beih. 11 (1958) 52. Type: PBS 36433.

13.6. *Setmeliola bayamonensis* Tehon var *guettardae* (Ciferri), *comb. nov.*

Basionym: *Meliola bayamonensis* Tehon var *guettardae* Ciferri, Mycopath. Mycol. Appl. 7(1954) 98. Type: Herb. S.

13.7. *Setmeliola brinkii* (Hansford), *comb. nov.*

Basionym: *Meliola brinkii* Hansford, Reinwardtia 3 (1954) 96. Type: BO 12315.

13.8. *Setmeliola canariicola* (Stevens ex Hansford), *comb. nov.*

Basionym: *Meliola canariicola* Stevens ex Hansford, Sydowia Beih. 1 (1957) 102. Type: PBS 34009.

13.9. *Setmeliola canthii* Hansford var *aristata* (Hansford), *comb. nov.*

Basionym: *Meliola canthii* Hansford var *aristata* Hansford, Proc. Linn. Soc. Lond. 51 (1945) 22. Type: Herb. IMI.

-*Meliola woodiana* Saccardo var *aristata* Hansford, Journ. Linn. Soc. Bot. 51 (1937) 284.

13.10. *Setmeliola circinans* (Earle), *comb. nov.*

Basionym: *Meliola circinans* Earle, Bull. New York Bot. Gard. 3 (1905) 304. Type: Heller 6347, NY.

13.11. *Setmeliola circinans* Earle var *rhynchosporae* (Hansford) *comb. nov.*

Basionym: *Meliola circinans* Earle var *rhynchosporae* Hansford, Sydowia 9

(1955) 13. Type: *Nash 1803*, FLS.

13.12. ***Setameliola coriae*** (Hueguenin), *comb. nov.*

Basionym: *Meliola coriae* Hueguenin, Rev. Mycol. (Paris) 34 (1969) 30. Type: Herb. P.

13.13. ***Setameliola cyperi*** (Patouillard in Gaillard), *comb. nov.*

Basionym: *Meliola cyperi* Patouillard in Gaillard, Le Genre *Meliola* (1892) 70. Type: Herb. FH.

13.14. ***Setameliola fusispora*** (Yamamoto), *comb. nov.*

Basionym: *Meliola fusispora* Yamamoto, Trans. Nat. Hist. Mus. Taiwan 31 (1941) 219. Type: Herb. TNS.

13.15. ***Setameliola kaduae*** (Stevens), *comb. nov.*

Basionym: *Meliola kaduae* Stevens, Bernice B. Bishop Mus. Bull. 19 (1925) 30. Type: Herb. ILL.

13.16. ***Setameliola martiniana*** (Gaillard), *comb. nov.*

Basionym: *Meliola martiniana* Gaillard, Le Genre *Meliola* (1892) 68. Type: *Rabenhorst's Fungi Europea* 3852 (Herb. F).

-*Irenopsis martiniana* (Gaillard) Stevens, Ann. Mycol. 25 (1927) 437.

-*Meliola perseae* Stevens forma *setulifera* Spegazzini. Bol. Acad. Nac. Cien. Cordoba 26 (1923) 380.

-*Meliola setulifera* Stevens, Ann. Mycol. 26 (1928) 285.

13.17. ***Setameliola microtricha*** (Sydow in Sydow & Sydow), *comb. nov.*

Basionym: *Meliola microtricha* Sydow in Sydow & Sydow, Ann. Mycol. 18 (1920) 157. Type: Herb. UC.

The Singapore record for this taxon is *C.F. Baker Fungi Malayana* 490 determined as *Tetrachia singularis* Saccardo (1918). The taxon is cited by Hansford (1961) as the type under *Meliola microtricha* H. Sydow & P. Sydow [see *Annales Mycologia* 18 (1920) 157]. The Saccardo description is of a sporodochial fungus and only conidia are described. Sydow & Sydow (1920) regarded *Tetrachia singularis* as a synonym of *Spegazzinia meliolae* Zimmerman. Damon (1953) considered that *Spegazzinia tessartha* (B & C) Saccardo comprised a monotypic genus and cited *T. singularis* as a synonym of *Isthmospora trichophila* (Atkinson) Damon. Hughes (1953) considered *T. singularis* to be a synonym of *Trichothrium*.

The UC specimens 490 and 491 (determined as *T. singularis*, *n. gen. et n. sp.*) from the *C.F. Baker Fungi Malayana exsiccatum* exhibit

two epifoliar fungi. The isthmospores of *T. singularis* or *T. asterophorum sensu* Hughes (1953) similar to those of *Spegazzinia*, are found in both specimens. *Tetrachia singularis* is a hyperparasite of a second fungus present that agrees with the Hansford (1961) description of *Setmeliola (=Meliola) microtricha*. No thyrtothecia of *T. singularis* were seen.

13.18. ***Setmeliola paratrophidis*** (Hansford), *comb. nov.*

Basionym: *Meliola paratrophidis* Hansford, Reinwardtia 3 (1954) 96. Type: Herb. BO.

13.19. ***Setmeliola pradosiae*** (Batista in Batista, Nascimento & Maia), *comb. nov.*

Basionym: *Meliola pradosiae* Batista in Batista, Nascimento & Maia, Inst. Micol. Publicação 25 (1956) 8. Type: Herb. URM.

13.20. ***Setmeliola pseudomori*** (Hansford), *comb. nov.*

Basionym: *Meliola pseudomori* Hansford, Proc. Linn. Soc. New South Wales (1954) 65. Type: Herb. IMI.

13.21. ***Setmeliola sakahensis*** (Yamamoto), *comb. nov.*

Basionym: *Meliola sakahensis* Yamamoto, Trans. Nat. Hist. Soc. Taiwan 30 (1940) 421. Type: Herb. BPI.

14. ***Trichomerium*** Spegazzini emend. Reynolds, Mycotaxon 14 (1982) 190.

-*Capnobatista* Ciferri & Leal in Batista, A.C. & R. Ciferri, Saccardo 2 (1963) 75.

-*Chaetopotius* Batista, Mycopath. Mycol. Mycol. Appl. 5 (1951) 151. *Pro parte*

-*Trip孢子opsis* Yamamoto, Special Publ. Kasai Shuppan Institute Minatoku Tokyo (1955) 55.

Ascospores hyaline, fusiform, 18-32 x 5-10 μ m. Hymenium periphysate. Asci fissitunicate, obclavate.

Ascocarp dark brown, setose, ostiolate 80-230 μ m. Mycelium of superficial, branching, septate hyphae, not setose nor hyphopodiate

14.1 ***Trichomerium grandisporum*** (Ellis & Martin in Ellis & Everhart) Batista & Ciferri, Saccardo 2 (1963) 210 (see Reynolds, 1982, for synonyms).

Ascospores hyaline, fusoid, granulate, 4-6 septate, 18-38 x 5-10 μ m. Asci aparaphysate, fissitunicate. Ascocarp ostiolate, 100-170 x 88-170 μ m; Setae 62.5-170 μ m in length. Mycelium of superficial, branching, septate hyphae, brown to blackish, not setose nor hyphopodiate.

Specimens reported: Singapore, Bukit Timah Reserve. Oct 2007. DRR 1, 5, 6, 14, 20, 22. (SING, UC).

Illustration: Batista & Ciferri 1963a: figs 75-96.

Distribution: Pantropical

Note: A specimen identified by F. von Höhnelt as *Aithaloderma setosum* is represented by a microscope slide preparation (IMI 63263, F). The sparse data indicate that the collections were made in Singapore in 1956. An unclear understanding of *Aithaloderma* species is manifested by different interpretations of the ascocarp. In one type, the setose ascocarp is globose similar to that of *Trichomerium*. Other species have been attributed with a shield over the ascocarp that is characteristic of *Chaetothyrium*. We find that the *Aithaloderma* examined by von Höhnelt should be assigned to *Trichomerium grandisporum*.

Acknowledgements

I thank the Singapore Botanical Garden for a Research Fellowship in October of 2007; Dr. M.M. Thang, Dr. D. Pfister and Dr. Paul Kirk made helpful suggestions.
