

ADDITIONS TO THE LIST OF NEW YORK PENTATOMIDÆ.

BY NATHAN BANKS.

Mr. Torre Bueno's article on Pentatomidæ near New York induced me to look over my collection of these insects, many of which were taken at or near Sea Cliff, L. I., my former home. I see that I have taken there all the species Mr. Torre Bueno lists except *Mineus bioculatus*. In addition there are several forms, some of which are not common.

Stiretrus anchorago Fabr.

One specimen taken at Roslyn several years ago.

Dendrocoris humeralis Uhler.

One specimen from Bayville Beach, May. I might mention that in Dr. Smith's New Jersey list this species is under two names; once as above, and again as *Liotropis humeralis*. *Liotropis* Uhler was pre-occupied, so Bergroth in 1891 proposed to change it to *Dendrocoris*.

Perillus circumcinctus Stål.

One specimen, taken years ago at Roslyn. *P. exaptus* is much more common, and overwinters as adult.

Podisus serieventris Uhl.

From Sea Cliff, March, May and August.

Banasa calva Say.

Specimens from Harbor Hill, July; and Sea Cliff, March and July.

Lioderma (Pentatoma) saucia Say.

This species occurs at Sea Cliff and vicinity in salt-grass meadows, in company with *L. senilis*, which is the more common.

Lioderma (Pentatoma) ligata Say.

One specimen from Sea Cliff, in August. The insect is common a little farther north.

Murgantia histrionica Hahn.

I have not seen this from Long Island, but in the past few years it has been recorded several times from near Jamaica, L. I., on cabbages.

Banks, Nathan. 1903. "Additions to the List of New York Pentatomidæ."
Journal of the New York Entomological Society 11, 227-227.
