Flowering specimens were obtained in December, 1911, of the *Hibbertia* (No.2259) mentioned in these Proceedings for 1911 (p.576), which show that the plant then referred to, is an erect form of *H. serpyllifolia*.

*Quintinia Sieberi* was found towards the head of Ruby Creek, just east of Mount Werong. Early Australian botanists soon noticed that the seeds of this tree often germinate in the caudices of Tree-ferns; the young plants thus produced gradually extend to the ground, and afterwards grow into large trees beside the Tree-fern (Plate lxxv.).

An interesting species of *Kunzea* (No.3175) from 2-3 feet high and somewhat straggling, was found flowering in December on the Big Plain, at an altitude of about 3,800 feet, and is probably a new species. The specimens collected are in the National Herbarium, Sydney.
