

Cambridge, Oct. 5.

Dear Sir,

The photograph
you sent belongs to one of
two species which could
easily be determined by
referring to the specimen itself.
If it was somewhat gelatinous
and elastic when fresh and
has become black in drying
it is Tremella foliacea. If
it was brittle when fresh and
is yellowish or brownish

when dry it is probably
Sparaxis crispa Fr.

Yours, respectfully
W.G. Farlow
