Spring Park,  
Charlottetown, P.E.I.

July 29, 1912

Dear Dr. Robinson:

Through some stupidity at the Charlottetown Postoffice Miss Clarke's prop was not delivered to me - as much mail before & since has been, very regularly - and she writes me that she has sent it to you. As I have all the other Rhodora matter it may perhaps be simplest if you will send the prop to me here. The full address as above will be certain to bring it.

We are back this morning from the first trip to the Magdalens having been exactly six and one half days getting back from there to Souris - a distance of less than 70 miles! The past week was violently stormy & the

little steamer which carries the mails<sup>2</sup>  
was forced to lie at anchor days and  
nights in dense fog or hurricanes,  
unable to approach the islands which  
are surrounded by broad sands  
and treacherous shallows. Fortunately  
for us, only two days of our return trip  
was spent on board - the rest being merely  
waiting impatiently & unable to do any-  
thing definite until the boat should come  
in.

The four of us - Bartram,  
Lang, St John & I - has got the July  
flora of the islands cleaned up to such  
an extent that it took much searching  
to turn up anything else so we are  
back on Prince Edward Island for a  
while. Bartram returns to Phila.  
at the end of the week, but Lang will  
remain into September & on the 12<sup>th</sup>  
of August we shall return again to  
the Magdalens for the late summer trip.

3

The Islands are interesting, each of  
the groups consisting of an intrusive hilly  
core with Carboniferous red Sandstone  
at the base & numerous ranges of  
white sand hills of washed sand +  
hundreds of little "pinebarren" pondholes.  
The sand hills are covered like Long Island,  
Cape Cod or the Pinebarrens with a  
carpet of Corema, Hudsonia, &c.; but  
the marshes and woodlands of the trap  
areas are similar to those of Gaspé &  
Anticosti, with numerous calciphiles of  
Rocky Mountain affinity. The beaches  
contain extensive carpets of somewhat  
unusual things: Pillaceagraria, a queer  
Atriplex very different from any of our ordinary  
things and apparently not related to them,  
Polygonum Roberti, Aster frondosus of the  
Rocky Mts., a queer Specularia, &c.

Here on Prince Edward Island we got  
some interesting things before the Neodalen

tip, the most surprising being the finding  
of Catula coronopifolia in greatest profusion  
and seemingly most indigenous (not any-  
where near wharves or towns) on the borders  
of brackish marshes with Montia lambertii,  
Stellaria crossifolia + humifusa, Catabrosa  
and the other good natives of the semi-saline  
areas.

Tomorrow we start out again for work  
on Prince Edward I. going to the region where  
John Macoun found Centunculus on the marshes.  
We shall stay on the island until the 2<sup>nd</sup>  
of August, then to the Magdalens for the  
later things, then back here for the last  
things.: Saxifraga, Atriplex, Aster &c.

We are in a very comfortable home -  
an old mansion with quantities of  
room for us and our work and good  
farm fare - a place secured through  
the local "authority", L.M. Watson, who is  
himself a second G.M.H. and much named  
because his new Violet (V. Watsoni) is not

5

recapituled in either manual!

I have today sent Wheeler's galley proof to make up a 12-page August Rhodora -  $\frac{2}{3}$  of Hubbard's homocletoidea article and 5 short articles or notes. I have left a total of 9 pages and two plates toward the September no. If you have anything in hand I shall be glad as nothing has come to me since June.

I hope you had a good visit at Seal Harbor and escaped the last wave. We didn't - for a week the mercury reached 90°-os here and we decided that the accounts of Prince Edward Island as a warm area were well founded.

I shall be glad if you have time to write to know how you find western Massachusetts and that you are well and getting a real rest. With kind regards to Mrs. Robinson. Very sincerely yours M. A. French
