## VIBRIO PAXILLIFER.

**0**\*\*\*\*\*\*\*\*\*\*\*\*\*\*\*\*\*

CHARACTER GENERICUS.

Vermis nudo oculo inconspicuus, simplicissimus, teres, elongatus.

Lin. Syft. Nat. Gmel. p. 3898.

CHARACTER SPECIFICUS, &c.

VIBRIO flavescens, paleis gregariis multifariam ordinatis.

Müll. an. inf. p. 54. t. 7. f. 3-7.

Baccillaria paradoxa.

Lin. Syft. Nat. Gmel. p. 3903,

Cum de hac specie accurate disseruit Dominus Müller, descriptionem ab illo contextam in opus meum transferre non dubitavi.

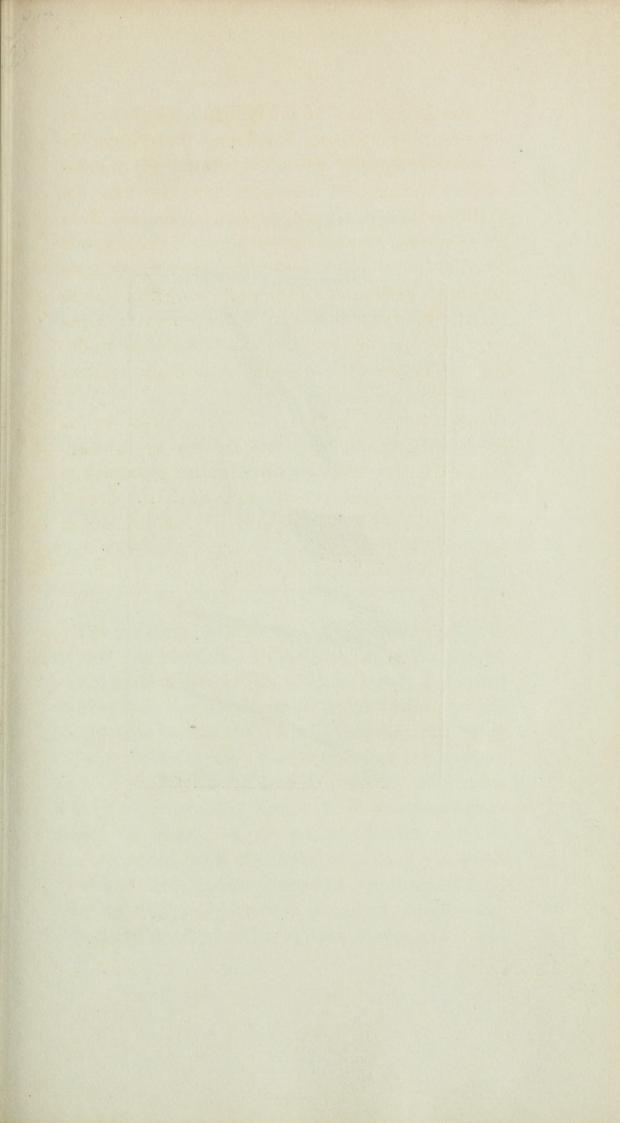

"Animalculum, vel congeries animalculorum mirabilis. Pluries in guttulis aquæ marinæ vidi corpufcula linearia flavescentia (solitaria paleas, in quadrangula disposita scobes referebant) granulaque seminalia qualiscunque vegetabilis diu credidi; demum nocte inter 6 & 7 Octobrem 1781 aspectu sili flavescentis, sese in longum producentis et in breve contrahentis, ac ex his paxillis compositi, obstupe-sactus, novoque phoenomeno gavisus, ejusdem variis evolutionibus incubui,"

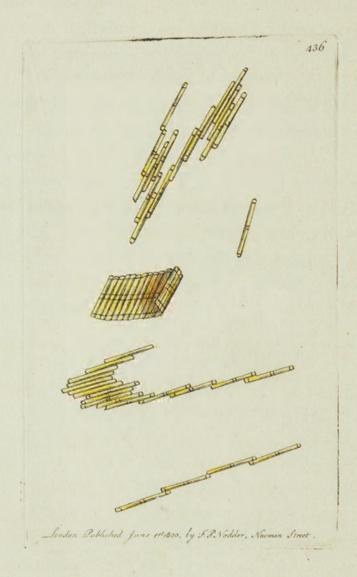

" Paxilli

"Paxilli nudo oculo inconspicui cute pellucida membranaque intestinali slavescente, punctisque binis aut tribus sparsis constare videntur. Hi numero senario ad quadragenarium situm quidem variant, at parallelum semper servant, vel quadratum, vel filum strictum, esformantes, aut in ziczac ducti fulminis directionem imitantur, vel filum utraque extremitate quadratum proferens, vel adhuc aliam siguram, oculo sistunt. Bini paxilli (unus in minori numero) a reliquis interdum in angulum rectum, vel acutum, divergunt; omnes membrana dilatabili mutuo coalitos suspicor.

Congeries hæc quadrangulari forma quiescere solet, mortuaque persistit, reliquas vero jam ab hac, jam ab illa, extremitate incipiendo lente efformat."

"In ulva latissima copiose, hinc marinus. Totum Octobrem 1781 plures reperi, posthac Septembre 1783 rursus apparuere."

# FESTUCINE VIBRIO.

### GENERIC CHARACTER.

Animalcule inconspicuous to the naked eye, simple, cylindric, elongated.

SPECIFIC CHARACTER, &c.

Yellowish VIBRIO, confisting of gregarious filaments variously disposed.

Straw-shaped VIBRIO.

Pipe VIBRIO.

The celebrated Müller, its first discoverer, informs us that this wonderful animalcule, or rather congeries of animalcules was found in sea water, appearing to consist of certain linear yellowish bodies, which singly represented a kind of silaments, but when disposed into a square, exhibited rather the appearance of small pieces of sawdust, and Mr. Müller for a long time supposed them to be of a vegetable nature. At length, on the 8th of October 1781 he was surprised with the sight of a long yellowish thread of these bodies evidently extending and contracting itself; and pleased at this novel phenomenon, diligently attended to its various evolutions. The

straws or filaments, which are scarce observable to the naked eye, feem, when microscopically surveyed, to confift of a pellucid skin, and a membranaceous yellowish intestine, with two or three scattered points or granules. These bodies, to the number of from fix to forty, vary their position, but always preserve their parallelism; forming themselves either into a fquare, an extended thread or line, a zigzag or interrupted line, or other different figures. Sometimes one of the filaments diverges from the rest, either at a right or an acute angle, and where the group confifts of but few filaments, two will fometimes diverge in the fame manner, and Mr. Müller fupposes that all the filaments are connected by means of an extensile membrane. The congeries or general heap rests in a square form, and remains thus when dead, but forms others, which proceed flowly fometimes from one, and fometimes from the other extremity. Mr, Müller observed this animalcule in plenty on some specimens of the Ulva latissima, in October, 1781, and again in 1783.
