

II. A REVISION OF THE GENUS RUMFORDIA.

BY B. L. ROBINSON.

The genus *Rumfordia*, originally described by the eldest De Candolle and dedicated to Count Rumford, was founded upon a single species, *R. floribunda*, a showy-flowered shrub from the uplands of central and southern Mexico. The genus was for more than fifty years believed to be monotypic, but in 1892 Mr. T. S. Brandegee published the description of a second and very distinct species, which he had discovered in the mountains of southern Lower California. From 1903 to 1905 Dr. Greenman amplified the records of the genus by characterizing two species from Costa Rica and a pubescent form of the original *R. floribunda*. As two more new species of *Rumfordia* have now been found in a very interesting collection of plants secured by the late E. Langlasse, it seems worth while to present here a résumé of the genus as far as it is known to date. The group is notable for its entire freedom from synonymy and nomenclatorial difficulties. Of its members not one appears to have borne any other name than the one here recognized.
