Hab. Seto-Uchi (Mososeki).

3. **MUCRONALIA LACTEA**, *A. Ad.*

Hab. Tanabe.

A milk-white pupoid species, with the aperture very oblique and produced.

4. **MUCRONALIA SUBULA**, *A. Ad.*

M. testa subulata, nivea, vix opaca, pupoidea, vertice obtuso, mucrone parvo; anfractibus normalibus 6, planis, suturis impressis; *apertura* normali, oblongo-ovata.

Hab. Simoda.

Like *M. lactea*, but larger, with more numerous whorls, and the aperture not produced nor oblique as in that species.

Subgenus SELMA, *A. Ad.*

Testa oblongo-ovata, tenuis, subdiaphana, spira brevi, anfractu ultimo magno. *Apertura* elongato-ovata, antice integra; labio arcuato, oblique subplicato.

1. **SELMA SUCCINIOLA**, *A. Ad.*

S. testa elongato-ovali, tenui, rimata, subdiaphana, cornea, rufo tintata, spira brevi; anfractibus $3\frac{1}{2}$, vix convexis, ultimo ampio; *apertura* oblonga; labio rufo tineto, plica subtortuosa rufa instructo, labro margine simplici.

Hab. O-Sima.

I have been necessarily obliged to keep this species distinct from the others on account of its short spire and the spiral twist on the inner lip. The only specimen I obtained is a little *Succinia*-shaped shell, and, were it not for the aperture being entire in front, might be taken for a very young *Olivella*.

On the Species of Rostriferous Gasteropods (*Strombidæ*, *Trichotropidæ*, *Cypræidæ*, and *Amphiperasidæ*) found in Japan. By ARTHUR ADAMS, F.L.S., &c.

[Read January 15, 1863.]

THE species of *Strombidæ* collected by me during the recent ex-

ploration of the coasts of Japan by H.M.S. 'Actæon' are all well-known species; in the family *Trichotropidæ* I was fortunate in finding a new *Iphinoë* and a beautifully-sculptured *Trichotropis*, besides nearly all the known species of that group. In the Cowry tribe nearly all the species are old Linnean shells. They are most numerous along the Pacific shores of the Japanese Islands, and more especially along the southern and eastern parts of Kiusu. The coral reefs of the Tropics are badly represented in Japan, and it is among the recesses of these that the Cowries delight to live. One new species only, belonging to the *Amphiperasidæ*, has occurred to me, most of the specimens found having been previously described by Sowerby from examples brought home by Sir E. Belcher and myself in H.M.S. 'Samarang.' The present paper presents a striking contrast to the others I have recently offered to the Society, which were principally composed of new species.
