

(Merremia)  
*Celtis rhinoceros* will hardly do for  
Scaphiolebia - as there is a *C. rhinoceros*  
which, although a syn. (probably) of  
*C. aculeata*, ought not to be used for  
a n. sp. Did I not state in my  
last letter that Planchon's monog. - a  
part substance of it, is in the 3rd Vol.  
of Walpér's Annal.? Our plant will  
stand next to *C. aculeata*. It is  
better to follow Planchon in considering  
the group to which this & its allies  
belong, as only a subgenus. He, how-  
ever regards *Momisia* Decne. as a  
syn. of *Sponia*, while Klotsch (in  
*Zimiae* xx) makes it the same as  
*Merremia* HBK. Who is to be  
followed?

What is *Celtis Texana* Schle (in Linn.)  
- with opposite leaves?

I asked you once for your names of Wright's Drypetes.  
Have you determined them? What do you make of  
Griebel's Californian *E. mullerbergii* since you  
refer his Penn. plant to *E. ramiflora*? I sometimes  
think there is but one Calif. species of this genus.  
The stigma varies according to age. Griebel's 1st  
and 2nd sections are undistinguishable. Little reliance  
can be placed on the length of the flower stalks. over

Torrey, John. 1831. "Torrey, John [undated] [3rd item]." *John Torrey letters*
