ABSTRACT: Complete label information is presented for all primary type specimens, allotypes, and neallotypes of Mecoptera, Megaloptera, Neuroptera, and Raphidioptera housed in the California Academy of Sciences. Numbers of non-allotypic paratypes are given with the names of states or provinces of the North American species, or countries of other nations.

INTRODUCTION

The California Academy of Sciences contains one of the major entomological type collections in the world. Although a rather young collection, it has been growing very actively since its 1915 reopening in Golden Gate Park after San Francisco's great earthquake and fire of 1906. Since that time it has become the largest collection of type specimens in the western continental North America, at present including more than 14,000 primary type specimens. In order to inform the scientific community as to what types exist in this collection, a series of catalogs has been published. Previous parts of this series include type catalogs of the Orthoptera (Rentz, 1965), Thysanoptera (Arnaud and Lee, 1973), and Diptera (Arnaud, 1979).

There are no primary types of Mecoptera and Neuropterida in this collection predating the 1906 earthquake. In fact, the first neuropteroid type in the collection was described in 1936. However, through the efforts of several contemporary neuropterists (*sensu lato*), the

California Academy of Sciences now contains one of the ten largest collections of neuropteroid types in the world. Currently there are 9 holotypes, 4 allotypes, and 64 paratypes of Megaloptera; 7 holotypes, 3 allotypes, and 89 paratypes of Raphidioptera; 77 holotypes, 2 lectotypes, 10 allotypes, 1 neallotype, and 190 paratypes of Neuroptera; and 12 holotypes, 3 allotypes, and 33 paratypes of Mecoptera in the collection. Among those researchers actively contributing to the neuropteroid and Mecoptera type collection during the past 30 years are: Phillip A. Adams (California), Horst and Ulrike Aspöck (Austria), George W. Byers (Kansas), Elvin D. Evans (Michigan), Jason G. H. Londt (South Africa), Martin Meinander (Finland), Victor J. Monserrat (Spain), Waro Nakahara (Japan), John D. Oswald (Washington, D. C.), Norman D. Penny (California), Lionel A. Stange (Florida), and Catherine A. Tauber (New York).

Primary types (holotypes, lectotypes, neotypes, and syntypes) are defined as those type specimens which are the name-bearing speci-

mens of the species and are used to definitely relate the name of the species to an individual with certain recognizable traits. Secondary types (allotypes, neallotypes, paratypes, etc.) are those type specimens used to delimit the phenotypic variation within a species. Although of marginal value in determining the true identity of a species, these secondary types are useful to some researchers and because we wish to maintain consistency in content within the series, these secondary types have been included. We have listed the number of paratypes, as well as country of origin, and in North America the state or province of origin. Where a paratype locality is found in a country deemed to have complex faunal relationships, such as Ecuador (Galapagos Islands) and Indonesia, we have provided more precise information. There is some confusion about the definition of neallotypes, as opposed to neoallotypes. Neallotype is herein defined as an allotype which was not part of the original type series, but subsequently designated as allotype. Until adoption of the 1985 edition of the International Code of Zoological Nomenclature (Recommendation 72A), there had been no formally accepted definition of allotype, and some workers preferred to designate allotypes from specimens other than the original paratype series, so the term neallotype was coined to separate these specimens from allotypes designated from the original type series.

Primary type specimens in the CAS collection are deposited through several different arrangements. Types from the University of California, Riverside, and Oregon State University, Corvallis, are entrusted to The Academy through a permanent deposit arrangement. The University of California, Berkeley, currently has an indefinite loan arrangement with the Academy. If not otherwise indicated, the included types are the permanent property of the California Academy of Sciences. All pinned specimens and any associated parts separated from the body have a label reading "California Academy / of Sciences / Type / No. / . . ." Also, all slides have a similar CAS type slide label attached. Where quoted label information contains a male or female symbol, we have indicated this with [MA] and [FE] letter and symbol combination. Further, where quoted label information contains ditto marks, these are in-

dicated by " rather than the quote marks " used to enclose label information.

We have tried to maintain the style of previous type catalogs. The information contained on labels is transcribed as closely as possible to the original print, although not all labels contain neat, linear lines of information, and occasional placement interpretation was needed. Each line is delimited by slash marks, and each label by quotation marks and a semicolon. The journal abbreviations in the text generally conform to those used by BIOSIS, although we prefer a more abbreviated listing for Psyche (Camb.). In the Literature Cited section, journal titles have been spelled out fully. The number of paratypes indicated is exclusive of any specimen designated as allotype or neallotype.
