

8. *Hyla fallax*. (Plate XXXIX. fig. 4.)

Tongue circular, slightly nicked and free behind. Vomerine teeth in two small round groups on a level with the posterior borders of the choanae. Head moderate, broader than long; snout rounded, as long as the diameter of the orbit; canthus rostralis indistinct; loreal region very oblique; interorbital space broader than the upper eyelid; tympanum distinct, half the diameter of the eye. Outer fingers almost half-webbed; no projecting rudiment of pollex; toes nearly entirely webbed; disks nearly as large as the tympanum; subarticular tubercles feeble. The tibio-tarsal articulation reaches between the eye and the tip of the snout. Skin smooth above and on the throat, granular on the belly. Dark purplish-brown above, with white markings, viz. a broad triangular blotch on the forehead, extending on the anterior half of the upper eyelid, a band on each side of the back, from the upper eyelid to the sacral region, and a subtriangular blotch on the coccygeal region; these markings enclosing a vase-shaped area of the ground-colour; a white blotch above the heel, and some white dots on the tibia.

From snout to vent 27 millim.

A single specimen from Katow, New Guinea; received from the Marquis G. Doria.

This tree-frog bears a striking superficial resemblance to the South-American *H. leucophyllata*, Beiris.

EXPLANATION OF THE PLATES.
