The avian genera *Tesia* and *Urosphena*

by Ben King

Received 23 January 1989

Delacour (1942) defined the genus Bradypterus as follows: "Rictal bristles very small and inconspicuous; throat, breast, under tail coverts and lesser wing coverts sometimes plain, sometimes streaked or spotted; tail about equal to wing or longer; bill slight." He defined Cettia (differentiating it from Bradypterus) as follows: "Rictal bristles well developed and visible; no dark markings on the body plumage. Rectrices soft, never stiff nor with underlying barring, always 10 in number. Thickness of bill variable." He then divided the genus Cettia into 3 subgenera. The subgenus Urosphena was distinguished by "Tail shorter than wing by 10 mm or more; bill long and narrow; pale supercilium long, broad and conspicuous", whereas the subgenera *Horeites* and *Cettia* had "Tail about equal to wing; pale supercilium shorter and less conspicuous". The subgenus *Horeites* was recognised by "Bill comparatively broad and thick; rectrices of normal width; tail coverts also normal; rictal bristles strong". The subgenus *Cettia* (containing only *C. cetti*) was recognised by "Bill narrow; rectrices broad; tail coverts long and broad; rictal bristles weak".

Delacour (1942) defined the genus *Tesia* by "very short rectrices [are] hidden by the tail coverts and slightly curved downwards. The bill is long, broad and flattened at its base, with a strong ridge on the upper mandible. The upper parts are dark grey or olive, and the underparts grey, darker or lighter." Delacour separated *Tesia castaneocoronata* off from *Tesia* and placed it in a new genus, *Chorotesia*, based on its longer rectrices, thin,

narrow bill, and brighter colour pattern.

White & Bruce (1986) placed Tesia everetti in the genus Urosphena, while Watson (in Peters 1986) considered Tesia everetti a subspecies of Urosphena subulata and placed Tesia castaneocoronata in the genus Oligura.

INVESTIGATIONS

I measured a series of *Tesia*, *Urosphena* and *Cettia* to see if the measurements and ratios might cluster. Also, tape recordings of all species of *Tesia*, *Urosphena* and *Cettia* and several species of *Bradypterus* were obtained in the field and compared (the tapes are on deposit at the Library of Natural Sounds in the Cornell University Laboratory of Ornithology) and field observations of all species of *Tesia*, *Urosphena* and *Cettia* and several species of *Bradypterus* were made.

RESULTS

(1) The genera Bradypterus and Cettia can further be separated by: (A) Bradypterus songs are insect-like and non-musical, while Cettia songs are musical, often staccato warbles; and (B) Bradypterus warblers walk, but

Cettia warblers hop.

(2) Cettia pallidipes belongs with Horeites and not Urosphena because: (A) its tail is too long (note that its wing/tail ratio clusters with Horeites and not Urosphena (Table 1); (B) its rectrices are of normal width (not narrow as in Urosphena): (C) its pale supercilium is shorter (like Horeites) than in Urosphena; and (D) its song is a staccato warble (Fig. 1) in the 1-4 KHz range (like most other Horeites) rather than the high pitched monotones at 8-10 KHz typical of Urosphena.

The only character pallidipes shares with Urosphena is a long narrow bill, which some Horeites also have. A better definition for Horeites would thus be "tail less than 20 mm shorter than wing length", while Urosphena

would be "tail more than 20 mm shorter than wing length".

(3) The genus *Tesia*, including *everetti*, is characterised by (A) loud staccato songs in the 1-3 KHz range (Fig. 1); (B) spending most time in

TABLE 1
Measurements (mm) and ratios of the genera *Tesia*, *Urosphena* and *Cettia*. (Number of specimens examined in brackets.)

	Wing	Tail	Tarsus	Wing/tail	Wing/Tarsus
	(mean)	(mean)	(mean)	ratio	ratio
Tesia castaneocoronata (10)	47.9	25.4	22.1	1.89	2.17
Tesia olivea (10)	46.5	18.3	22.6	2.54	2.06
Tesia cyaniventer (10)	48.9	17.9	23.7	2.73	2.06
Tesia superciliaris (8)	46.6	16.1	24.5	2.89	1.90
Tesia everetti (8)	51.0	18.7	23.7	2.73	2.15
Urosphena squameiceps (10)	52.9	29.3	18.2	1.81	2.91
Urosphena whiteheadi (5)	50.0	22.4	19.7	2.23	2.54
Urosphena subulata (7)	53.6	25.2	19.6	2.13	2.73
Cettia pallidipes (4) Cettia major (4) Cettia brunnifrons (10)	49.6	39.5	19.6	1.26	2.53
	63.6	52.5	24.6	1.21	2.59
	46.7	41.4	16.8	1.12	2.78
Cettia acanthizoides (10)	51.8	47.8	20.8	1.08	2.49
Cettia diphone cantans (5)	66.2	65.0	24.2	1.02	2.74
Cettia diphone cantans (5)	56.6	54.1	22.3	1.05	2.54
Cettia cetti (10) Cettia fortipes (10)	61.0 54.2 49.6	58.6 50.9 50.5	21.6 20.5 20.7	1.04 1.06 0.98	2.82 2.64 2.40
Cettia vulcania everetti (10) Cettia flavolivacea (6)	54.4	54.3	22.0	1.00	2.47

(3) The genus *Tesia*, including *everetti*, is characterised by (**A**) loud staccato songs in the 1–3 KHz range (Fig. 1); (**B**) spending most time in dense undergrowth rather than on the ground (although they are often seen on the ground); (**C**) a curious kind of sidewise movement along branches in the undergrowth when disturbed; (**D**) a wing/tarsus ratio of 1.90–2.17 (Table 1), compared to 2.54–2.91 for *Urosphena* and 2.40–2.82 for *Cettia*; and (**E**) a wing/tail ratio of 1.89–2.89 (Table 1), compared to 1.81–2.23 for *Urosphena* and 0.98–1.26 for *Cettia*.

I have here included castaneocoronata with Tesia because it conforms in all these aspects to Tesia, even though it differs in its longer tail (longer than tail coverts), thin bill and bright colours. Perhaps Oligura is best

regarded as a subgenus of Tesia.

(4) The genus *Urosphena* is characterised by: (**A**) high-pitched monotone songs in the 8–10 KHz range which are difficult or impossible for many people to hear (Fig. 1); (**B**) spending most of the time on the ground (less often in undergrowth than *Tesia*); (**C**) lacking the curious sidewise movement of *Tesia*; (**D**) a wing/tarsus ratio of 2.54–2.91 (Table 1); and (**E**) a wing/tail ratio of 1.81–2.23 (Table 1).

Since Urosphena is such a distinct cluster, I prefer to treat it as a genus separate from Cettia. While the general behaviour of Cettia and Urosphena is similar, the songs of these 2 groups are radically different, as is their wing/tail ratio. It should be noted, however, that C. acanthizoides and C. brunnifrons have elements in their songs which resemble Urosphena (especially acanthizoides—see Orenstein & Pratt 1983), although at a lower pitch. C. pallidipes clearly does not belong to Urosphena and is not even particularly close to it.

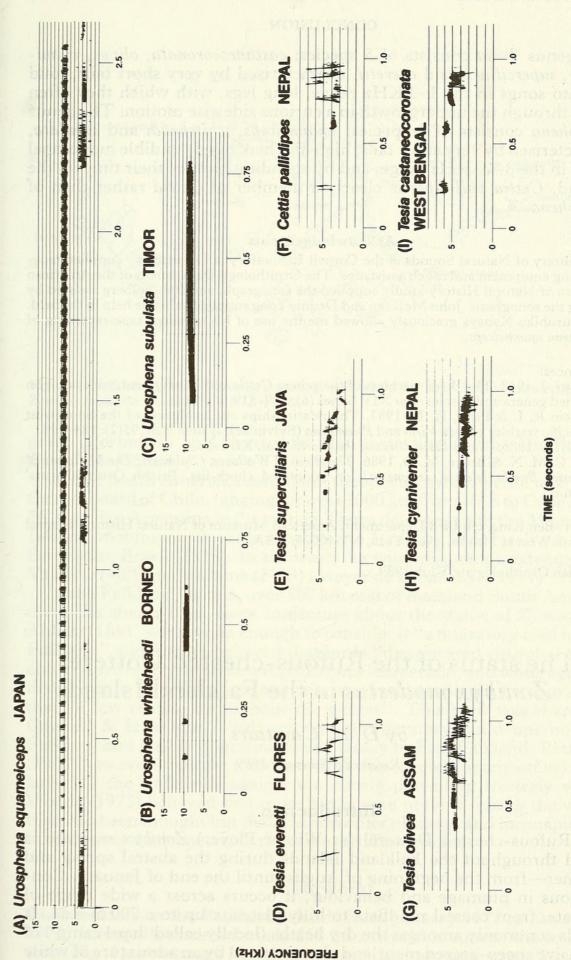

Figure 1. Sonograms of all the species of the genus Urosphena and Tesia, plus Cettia pallidipes. (A smaller scale is used for the genus Urosphena.) The 3 songs in the 2-5 KHz range on the Urosphena squameiceps sonogram are from Cyanoptila cyanomelaena. The entire song of Urosphena squameiceps is in the 7.5-9.5 KHz range. Compare (C) Urosphena subulata with Tesia everetti; and compare (F) Cettia pallidipes with (A), (B) and (C), the species of the genus Urosphena.

CONCLUSION

The genus Tesia consists of 5 species: castaneocoronata, olivea, cyaniventer, superciliaris and everetti, characterised by very short tails, loud staccato songs in the 1-3 KHz range, long legs, with which they often move through the undergrowth in a curious sidewise motion. The genus Urosphena consists of 3 species: squameiceps, whiteheadi and subulata, characterised by very short tails, high-pitched, barely audible monotonal songs in the 8-10 KHz range, and by spending most of their time on the ground. Cettia pallidipes is clearly a member of Cettia rather than of Urosphena.

Acknowledgements

The Library of Natural Sounds at the Cornell Laboratory of Ornithology supplied taperecording equipment and much assistance. The Ornithology Department of the American Museum of Natural History kindly supplied the sonograph, and Bob Solberg assisted by making the sonograms. John McKean and Dennis Yong supplied valuable help in the field. Mr Tsuruhiko Kabaya graciously allowed me the use of his excellent tape-recording of Urosphena squameiceps.

The status of the Rufous-chested Dotterel Zonibyx modestus in the Falkland Islands

by D. N. Carstairs

Received 6 February 1989

Introduction

The Rufous-chested Dotterel (or Winter Plover) Zonibyx modestus is found throughout the Falkland Islands during the austral spring and summer-from the beginning of August until the end of January. Conspicuous in plumage and behaviour, it occurs across a wide range of habitats, from coastal mudflats to hilly plateaux up to c.700 m a.s.l. It breeds commonly amongst the dry heaths (locally called 'hard camp') of extensive sheep-grazed moorland characterised by an admixture of white
