

ceolato-ellipticis acutis, ad basin in petiolum longe acuminatis, utrinque dense puberulis; inflorescentiis terminalibus solitariis usque ad 15 cm. longis densissime multifloris percrassis robustis valde multibracteolatis densissime albido-hirsutis; bracteolis valde perspicuis numerosissimis valde divergentibus ca. 2 cm. longis oblongis ad apicem attenuatis et in juventute valde recurvatis.

Subshrub; stems and branches acutely tetragonal, conspicuously alate-margined, densely grayish- or brownish-pubescent throughout; nodes abbreviated, 1—3 cm. long, the lowest to 7 cm.; leaves decussate-opposite, sessile or subsessile, thin-chartaceous, grayish-green, somewhat lighter beneath, elliptic or lanceolate-elliptic, to 7 cm. long and 3 cm. wide, acute or obtusish at the apex, regularly sharp-serrate along the margins almost to the base, long-acuminate at the base into what could be called a margined short petiole, densely puberulent on both surfaces; midrib slender, flat above, slightly prominulous beneath; secondaries slender, numerous, close, 7—10 per side, arcuate-ascending, flat above, hardly prominulous beneath; inflorescence spicate, terminating each stem and branch, sessile or very short-pedunculate, stiffly erect, very heavy and robust, very densely many-flowered, to 15 cm. long and 3 cm. wide, very conspicuously bracteolate, densely white-hirsute; bractlets very conspicuous and numerous, oblong-linear, about 2 cm. long, 1.5—2 mm. wide, long-attenuate at the apex, widely divergent, arcuately recurved before and during anthesis, less so after anthesis, densely hirsutulous; calyx cylindric, about 15 mm. long, densely puberulent, hirsutulous on the 5 ribs, the rim sharply 5-toothed; corolla hypocrateriform, its tube about 2 cm. long, the limb about 1 cm. wide.

The type of this distinctive species was collected by Paul C. Hutchison and J. Kenneth Wright (no. 3645) in a niche at the base of a granite cliff, Rio Chamaya, 166 km. east of Olmos, at an altitude of 700 meters, in the province of Jaen, Cajamarca, Peru, on January 19, 1964, and is deposited in the herbarium of the University of California at Berkeley.

#### ADDITIONAL NOTES ON THE GENUS VERBENA. II

Harold N. Moldenke

In the 1965 reference given above this species is referred to as "L. lipozygioides Walp." through a typographic error.

**VERBENA LITORALIS H.B.K.**

Additional bibliography: Hocking, Excerpt. Bot. A9: 365. 1965; Moldenke, Phytologia 13: 205--206. 1966; Moldenke, Résumé Suppl. 13: 3. 1966.

Játiva & Epling found this plant growing in secondary forests. Material has been misidentified and distributed in herbaria as V. carolina L. and even as Salvia nigriflora Epl. in the Lamiaceae.

Turczaninow (1863) has this to say about his Verbena nudiflora: "V. caule erecto tetragono, inferne folioso, superne paucifolio vel omnino foliis denudato, di- vel trichotomo, divisionibus simplicibus monostachyis, vel iterum divisis 2--3 stachyis, spicis filiformibus; foliis anguste-lanceolatis, basi longe attenuata, sessilibus, acutiusculis, a medio ad apicem argute et saepe inaequaliter serratis, supra punctis bullatis, interdum breviter piliferis exasperatis, subtus ad nervationes strigillosis; bracteis lanceolato-subulatis calycem aequantibus; nuculis striatis laevibus. In insula Sandwicensi Wahoo lecta. Species V. angustifoliae simillima, sed praeter folia bullata recedit floribus fructibusque duplo minoribus, praeterea nuculas in V. angustifolia semper transverse rugosas vidi. Ad hanc speciem proximae et nonnisi diversae panicula saepe ramosissima pedalii et bipedali e spicis numerosis constante, ad ramifications tantum foliis diminutis integerrimis instructa: specimen a Galipan, prov. Caracasanae Funk No. 325, e Cumana prope Cumanacoa Funk No. 54 et Galeotti No. 359. Nuculas ejusdem magnitudinis, apice parum rugulosae, folia latiora et angustiora. Haec forte ad V. longifoliam Mart. et Gal. spectant.... Sed specimina Funkiana e Caripe sub No. 637 et Lindenianum e vic-

iniis Meridae panicula multo minus ramosa et oligostachya gaudentia, fere medium tenent inter hanc et V. nudiflora. An omnes ad speciem unicum reducendae. Planta in schedula dicitur annua. Stirps Novo-Grenadensis e prov. Ocana, Schlim. No. 564 speciem valde propinquam indicat at caule e schedula fruticoso et foliis parvis, in pagina superiore integerrimis paucidentatis recedente." He places the species in the Section Leptostachya.

## VERBENA PLATENSIS Spreng.

Additional bibliography: Hocking, Excerpt. Bot. A9: 366. 1965; Moldenke, Phytologia 13: 216-217. 1966.

## VERBENA PLICATA Greene

Additional synonymy: Verbena placata Greene, in herb.

Additional bibliography: Hocking, Excerpt. Bot. A9: 366. 1965; Moldenke, Phytologia 13: 217. 1966.

Recent collectors have found this plant growing in loose sand, gravel, sandy silt, caliche, and in a mixture of gravel and sandy silt. Material has been distributed in herbaria (probably through a transposition of labels) as Larrea tridentata Coville in the Zygophyllaceae. On the other hand, the Rios & Cavazos 205 & 221, distributed as V. plicata, are V. halei Small. Malacara P. & Gutierrez F. 21 and Rios & Cavazos 233 are mixtures with V. halei.

Additional citations: TEXAS: Duval Co.: N. Castillo 6 (Ld); Malacara P. & Gutierrez F. 35 (Ld). Hidalgo Co.: R. A. Leal 30 (Ld). ## VERBENA PORRIGENS R. A. Phil.

Additional bibliography: Moldenke, Phytologia 11: 477. 1965.

Additional citations: CHILE: Aconcagua: Landbeck s.n. [near Quilimar, Dec. 1861; Herb. Mus. Nac. Hist. Nat. Chile 54729; Macbride photos 17441] (W--photo of isotype).

## VERBENA PULCHELLA Sweet

Additional synonymy: Glandularia pulchella (Sweet) Troncoso, Darwiniana 13: 473. 1964. Glandularia pulchella var. pulchella Troncoso, Darwiniana 13: 475 & 476. 1964.

Additional bibliography: Troncoso, Darwiniana 13: 468-470 & 473-476, fig. 2. 1964; Moldenke, Phytologia 11: 477 (1965) and 13: 192. 1966; Shinners, Sida 2: 266. 1966.

Additional illustrations: Troncoso, Darwiniana 13: 474, fig. 2. 1964.

Troncoso (1964) describes this species as follows: "Planta perenne, sufruticosa en la base, de tallos generalmente muy extendidos, postrados y apoyantes, radicantes sólo en la base luego ascendentes. Ramas subtetragónas estrigoso-pubescentes a veces hirsústulas, entrenudos largos, de 2-6 cm long. Hojas pinnatisectas, con fascículos de hojitas menores en las axilas, atenuadas en breve pecíolo, lámina de ámbito oval-triangular, lacinias linear-lanceoladas, subagudas, estrigosas en ambas caras, en la inferior sobre el borde y el nervio medio prominante, epífilo surcado, hipófilo comúnmente con puntos pelúcidos (sub lente),

margen revoluto (principalmente en material de herbario). Inflorescencia solitaria en ramitas terminales erguidas, en densas cabezuelas capituliformes en la floración que se alargan después de la antesis en delgadas espigas de 5—6 cm long. Brácteas oval-lanceoladas, de 3,5—4 long., subcóncavas en la base, rala o densamente estrigosas, hirsútulas en el borde y porción basal. Cáliz tubuloso, de 8—9 mm long. (incluidos los dientes), estri-goso o cano-estrigoso en toda su superficie, dientes oval-subulados, desiguales, los mayores de 0,8—1 mm long., rectos o subrectos. Brácteas, cáliz y nervios en el envés de la hojas con pequeñísimas glándulas pateliformes, subsesiles. Corola glabra exteriormente, tubo superando 1/3 el cáliz. Estambres típicos, los dos superiores con apéndices anterales cilíndricos, delgados, que superan las tecas asomándose en la garganta corolar. Pistilo típico, estilo filiforme de 7,5—8 mm long. Mericarplos cilíndricos de 3,5—4 mm long., ápice subrostrado, superficie dorsal pardo-negruzca, reticulado-estriada, la ventral, blanco verrucosa (ver figura), pericarpio prolongado y ensanchado en la base, ésta huera."

She notes "Habita en campos altos y arenosos del S de Brasil, Uruguay, centro y litoral argentino. Es una especie muy variable!" She cites from Buenos Aires Burkart 23908 (Si) and 8490 (Si) and cultivated in Buenos Aires Herb. Bentham s.n. [Soc. Hort. London, 20-VII-1829] (K), and from Uruguay Felippone 3147 (Si).

She separates two varieties as follows:

1. Plants ascending or prostrate, rooting only at the base.
2. Bractlets lanceolate-subulate, strigose-hirsutulous; calyx-teeth subulate; anther-appendages cylindric, slightly exserted from the corolla-throat.....V. pulchella.
- 2a. Bractlets oval, "pestafiosas", subglabrous; calyx-teeth acute, apiculate, short; anther-appendages club-shaped, plainly exserted from the corolla-throat.....  
.....V. pulchella var. clavellata.
- la. Plants creeping, in general low, much shorter and more slender.....V. pulchella var. gracilior.

However, after examining an isotype of her var. gracilior, I find this to be typical V. selloi Spreng. Herter 1805 [Herb. Herter 96556] was cited by me in a previous work as V. dissecta f. alba Moldenke, but seems definitely to represent V. pulchella instead. The H. M. Smith 5, cited below, was erroneously cited by me as V. tenera Spreng. in Phytologia 11: 275 (1965) and was originally distributed as V. tenuisecta Briq. Troncoso (1964) cites Rodrigo 2339 as V. dissecta, but the New York Botanical Garden specimen of this collection, at least, is definitely V. pulchella. Rosengurtt B.992, which I previously cited a V. pulchella, proves to be the type collection of V. subincana (Troncoso) Shinners.

Rambo 48914 is described by the collector as prostrate, with violet flowers, growing in sandy places. Herter encountered the species at 2 meters altitude. The Boffa 330, T. Meyer 12290, and

Rambo 48914, cited below, were previously erroneously cited by me as V. dissecta Willd. On the other hand, the Frenguelli 105 & 137, previously cited by me as V. pulchella, appear to be V. dissecta instead. Similarly, Herb. Herter 83911, Herter 181g, and J. T. Lima s.n. [II.1946; Herb. Rio Jan. 55466], previously cited by me as V. pulchella, are V. subincana, but Herb. Herter 50882, originally distributed by the collector as V. pulchella and cited by me previously as V. dissecta, is actually V. selloi Spreng.

The very old Commerson and Saint-Hilaire collections cited under V. dissecta and V. selloi have the name V. pulchella given as a synonym of V. tenera on their labels in a very old handwriting, but I do not think that this reduction is valid.

Additional citations: BRAZIL: Rio Grande do Sul: Rambo 48914 (N). URUGUAY: Herter 1805 [Herb. Herter 96556] (N, Z); H. M. Smith 5 (W--1193661). ARGENTINA: Buenos Aires: Boffa 330 (N). Salta: T. Meyer 12290 (N).

#### VERBENA PULCHELLA f. LATILOBATA Moldenke

Additional bibliography: Moldenke, Phytologia 11: 26. 1964; Troncoso, Darwiniana 13: 468, 470, & 484--485. 1964; Moldenke, Phytologia 13: 192. 1966.

Troncoso (1964) reduces this taxon to synonymy under V. dissecta Willd., but I do not agree. Its characters are much closer to those of V. pulchella if I am interpreting this species and V. dissecta correctly.

#### VERBENA PULCHRA Moldenke

Additional bibliography: Moldenke, Phytologia 11: 478. 1965; Rambo, Pesquis. Bot. 21: 51 & [60]. 1965.

Rambo (1965) cites Herb. Anchieta 29682 [Henz s.n.] from Rio Grande do Sul. He describes the plant as "Very vigorous, erect, apparently more than 1 m high", growing in "Wet, densely and highly vegetated Campos". He notes "Only one findplace in the northeastern Lowlands" of Rio Grande do Sul, and gives the general distribution of the species as "S. Paulo to Misiones and Uruguay".

#### VERBENA PUMILA Rydb.

Additional bibliography: Moldenke, Biol. Abstr. 45: 2772. 1964; Moldenke, Résumé Suppl. 12: 1. 1965; Hocking, Excerpt. Bot. A9: 366. 1965; Moldenke, Phytologia 11: 478, 490, & 491 (1965) and 13: 186. 1966; Moldenke, Résumé Suppl. 13: 2. 1966.

Bruni & Pena found this plant growing in rocky loam in Nuevo León; others have found it in red loamy soil, red sandy loam, or red soil, and among road and gravel in xerophytic canyons, as well as in fairly sandy soil along roadsides. Parks, Warnock, & Turner refer to it as a "low infrequent annual" with "whitish flowers" (their collection may, therefore, represent f. albida Moldenke; the base of the cocci in this collection is wide-flaring, a puzzling character occasionally seen in speci-

mens tentatively regarded and cited as V. pumila). The J. A. de la Cruz s.n. [12.IV.1961], distributed as V. pumila, is actually V. cameronensis L. I. Davis.

Additional citations: TEXAS: Burnet Co.: C. L. Lundell 15050 (Ld); McCart 6079 (Ld). Frio Co.: Lucas, Painter, & Barkley 14213 (Ld); Painter, Lucas, & Barkley 14201 (Ld). La Salle Co.: A. Cantu 71 (Au-222196). Llano Co.: Rose-Innes & Warnock 793 (Ld). Medina Co.: Barrera & Laurel 111 (Ld). Val Verde Co.: Parks, Warnock, & Turner 236 (Mi). MEXICO: Nuevo León: F. A. Barkley 14281 (Ld); Bruni & Pena 38 (Au-232622, Ld); Oatman & Rowlett s.n. [3 Feb. 1964] (Au-227525). San Luis Potosí: J. Rzedowski 7536 (Ip).

#### VERBENA PUMILA f. ALBIDA Moldenke

Additional bibliography: Moldenke, Biol. Abstr. 45: 2772. 1964; Moldenke, Phytologia 11: 478. 1965.

Possibly Parks, Warnock, & Turner 236, from Val Verde County, Texas, and described as having "whitish flowers", may belong here. Its cocci are wide-flaring at the base, and it is cited herein tentatively as V. pumila Rydb.

#### VERBENA QUADRANGULATA Heller

Additional bibliography: Moldenke, Phytologia 11: 478. 1965.

This species has been collected in fruit also in February. Recent collectors have found it in sandy or light tan sandy loam, gravel or Pleistocene gravel, light tan clay, fine sandy silt or grayish calcareous silt, light grayish-tan sandy loam, light-tan or loose light-tan sand, pale-tan loose sand, very loose light-tan sand, sandy silt, red or deep orange sand, and in hard-packed soil, on riverbottoms, in openchaparral pastures, and at the water's edge. The Flores call it "abundant in caliche", while Gamez describes it as "common in fine sandy silt". The I. Moran 10, distributed as V. quadrangulata, is actually V. ciliata var. pubera (Greene) Perry, while Barrera & Laurel 111 is V. pumila Rydb.

#### VERBENA RADICATA var. GLABRA (Hicken) Moldenke

Additional bibliography: Moldenke, Phytologia 11: 478. 1965; Moldenke, Résumé Suppl. 12: 13. 1965.

#### VERBENA RAMBOI Moldenke

Additional bibliography: Moldenke, Phytologia 11: 52-53. 1964; Rambo, Pesquis. Bot. 21: 51 & [60]. 1965.

Rambo (1965) cites Herb. Anchieta 25786 and 25787 from Rio Grande do Sul, both collected by himself. He suggests that the taxon may be conspecific with *V. stellaroides* Cham., and describes it as "Erect, stiff, coarse, about 30 cm high", growing in "Slightly shrubby Campos" on the "Southwestern plains only" in Rio Grande do Sul. He gives its general distribution as "So far, RGS [Rio Grande do Sul] only."

#### VERBENA RECTA H.B.K.

Additional bibliography: Moldenke, Phytologia 11: 478. 1965.

Recent collectors have found this plant growing in *Abies* forests, *Abies religiosa* woods, and *Pinus hartwegii* woods, at altitudes of 3000 to 3200 meters, flowering in July. The Paray 2449, distributed as *V. recta*, is actually *V. carolina* L.

Additional citations: MEXICO: Federal District: Paray 564 (Ip); Hidalgo: Galván s.n. [4.VIII.1963] (Ip). México: J. Rzedowski 18409 (Ip), s.n. [4.VIII.1962] (Ip).

#### VERBENA REITZII Moldenke

Additional bibliography: Moldenke, Phytologia 11: 58-59. 1964; Rambo, Pesquis. Bot. 21: 51 & [60]. 1965.

Rambo (1965) cites Herb. Anchieta 50761 [Reitz 3663] and 50794 [Reitz 3726] from Santa Catarina. He describes the plant as a "Suffruticose perennial, erect, apparently about 1 m high", growing in "Wet, apparently densely vegetated Campos" and notes

"To be found along the northeastern frontier" of Rio Grande do Sul, but notes that its general distribution is "So far, SC [Santa Catarina] only".

**VERBENA REITZII var. CASTRENSIS Moldenke, var. nov.**

Haec varietas a forma typica speciei recedit ramis ramulisque foliisque antrorse strigosis, foliis 1--1.5 cm. longis ad basin acutis sessilibus, inflorescentiis spicatis usque ad 2.8 cm. elongatis.

This variety differs from the typical form of the species in having the stems, branches, branchlets, leaves, and peduncles appressed-strigose with antrorse hairs, the leaves only 1--1.5 cm. long and acute at the sessile (not amplexicaul) base, and the inflorescences becoming to 2.8 cm. long during and after anthesis.

The type of the variety was collected by Lyman Bradford Smith, Roberto M. Klein, and Gerdt Günther Hatschbach (no. 14526) in rocky campos, sandstone ledge, stream margin, bog, forest, and fallow field, at Carambei by the Rio São João, ca. 24°30' S., 50°02' W., at an altitude of 950 meters, municipality of Castro, Paraná, Brazil, on January 15, 1965, and is deposited in the H. N. Moldenke herbarium at Plainfield, New Jersey.

Citations: BRAZIL: Paraná: Smith, Klein, & Hatschbach 14526 (Z—type).

#### XVERBENA RYDBERGII Moldenke

Additional bibliography: Moldenke, Phytologia 11: 462 & 479. 1965; Moldenke, Résumé Suppl. 13: 1. 1966; Gaiser, Surv. Vasc. Pl. Lambton Co. 100. 1966.

One each of the A. R. Moldenke 819 and 942 specimens cited previously as being deposited in my own herbarium is now in the Aarhus University herbarium. Heidenreich found this hybrid growing in an open field in Ontario. Gaiser (1966) says "only at Point Edward, V. hastata was on lower land under the Ambassador Bridge, V. stricta, on sandy banks of St. Clair R.; numerous hybrids were along the roadway between the parents and intermingled

with V. stricta."

Illustrations: Troncoso, Darwiniana 13: 483, fig. 6. 1964.

Troncoso (1964), in resurrecting this species from synonymy, cites the following specimens: URUGUAY: Burkart 21553 (Si); Collector undesigned s.n. [Carrasco, II. 1835] (P); Felippone 3071 (Si), 2240 (Si), 2725 (Si), 2742 (Si), 2784 (Si), 2874 (Si), 3386 (Si); Herb. Herter 87430 (Si); Herter 68181 (Si); Langeron s.n. [Carrasco, II. 1927] (P); Osten 5642 (Si); H. L. Parker s.n. [Carrasco, 23.X.1942] (Si--25668); Rosengurtt 1004 (Si), 2116 (Si), B.182 (Si); Rosengurtt & al. 1433 (Si).

She describes the species as follows: "Planta perenne, rastrera, radicante en todos los nudos formando céspedes extensos, ramas floríferas erguidas. Tallos subtetragónos verde-violáceos, lisos, glabrescentes o con pubescencia hispida, extendida o retrorsa en tallos y pedínculos, mas densa hacia el extremo de los mismos. Entremudos breves, de 0,5—2 cm long. alargándose hacia el ápice de las ramas hasta 5 cm long. Hojas pinnatisectas, de 0,7—2 cm (raro mayores) long. x 0,5—1,5 cm lat., de ámbito triangular,

enangostadas en breve pecíolo, con un fascículo de hojitas reducidas o breves ramitas en las axilas; lacinias breves, subagudas u obtusas, con margen extendido (subrevoluto en el material seco), glabras o con pelitos rígidos, subcallosos en la base en el haz e hirsutas en el borde y nervios del envés, éste con puntos pelúcidos (visibles sub lente), nervio medio impresio en el epífilo, prominente en el hipofilo. Inflorescencia en 2 o 3 cabezuelas terminales, más rara vez solitarias, espiciformes en la fructificación hasta de 4 cm long., pedunculada, pedúnculos laterales, generalmente más largos que el central, con pelitos hispidos extendidos o retrorsos. Brácteas lanceoladas, subuladas, de 4—5 (—6) mm long., pestafosas, el resto glabras. Cáliz cilíndrico, verdoso-violáceo, de 7—8 mm long. (incluidos los dientes), hirsuto sobre las costillas, el resto hispíduo o subglabro, dientes desiguales, subulados, los mayores de 1 mm long., rectos. Brácteas y costillas de cáliz con brevísimas glándulas pateliformes, subsésiles. Corola pubescente exteriormente en el ápice del tubo y base de la cara inferior de los lóbulos, tubo de 1 cm long. Estambres típicos, los superiores con apéndices anterales cilíndricos que superan notablemente las tecas, exertos en la garganta corolar. Gineceo típico, estílo filiforme de 0,8—1 cm long. Mericarpios cilíndricos, pardiscos, de 2,8—3 mm long., redondeados y alveolados en el ápice, truncados en la base, cara dorsal alveolado-sureada, cara ventral blanco-verrucosa, pericarpio levemente prolongado en la base, pero no ensanchado."

She notes that the species is "Abunda en praderas arenosas del litoral marítimo uruguayo." She also comments that "Esta especie es muy característica y fácilmente diferenciable de sus afines por formar densos y extendidos céspedes muy floríferos y por su pubescencia en general hirsuta y los pedúnculos hispido-retrorsos." "Si bien la descripción de Sprengel es muy breve, es en todo bastante coincidente, por lo cual creo conveniente rehabilitar este antiguo nombre, pues de no hacerlo debería describirse como un nuevo taxón."

Collectors describe this plant as 1—2 dm. tall, the corollas varying from blue, bluish, or purplish-blue to violet, lilac, purple, bright purple-lilac, or reddish. They have found it growing in dry sunny sandy or dry rocky campos, dry sandy pastures, and maritime meadows, as well as on grassy slopes, at altitudes of 10—2000 meters, flowering from September to February and in April. The common names "margarita morada" and "yerba meona" are recorded by Herter in Uruguay. Swallen describes it as very common along roadsides in campo, while Smith refers to it as littoral.

Material of V. selloi has been misidentified and distributed in herbaria under the names V. dissecta Willd., V. erinoides Lam., V. laciniata (L.) Briq., V. microphylla H.B.K., V. pulchella Sweet, V. tenera Spreng., and V. tenuisecta Briq. The Chicchi 264 collection, cited below, is a mixture with V. hookeriana (Covas & Schnack) Moldenke. The label on the Rosengurtt B.2116 specimen, also cited below, originally was inscribed "B-2116 1/2", but the fraction was apparently later crossed out.

The flowers are described as "blue" on Berro 134, 4753, 4754, 6720, & 8219; "blue or violet" on Berro 4752; "purplish-blue" on Berro 8205; "bluish" on Berro 8390; "violet" on Berro 4323, Krapovickas 2752, and Burkart 22380; "reddish" on Schreiter 6643; "lilac" on Herter 1811; "purple" on Berro 8701 & 8775; and "bright purple-lilac" on Herb. Herter 50882.

The Chicchi 264, in part, Gallinal, Aragone, Bergalli, Campal, & Rosengurtt 1433 & 1821, Herb. Herter 50882, Herb. Jussieu s.n., and Rosengurtt B.2116, cited below, were all previously erroneously cited by me as V. dissecta Willd.; all the rest cited below were previously cited by me as V. tenera Spreng. These changes in determination are due, in large part, to the splendid revisionary work recently published by Troncoso (1964) on certain Argentine members of this species complex. It is probable that most of the material cited by me previously under V. tenera will prove, upon re-examination, to be V. selloi. The Bailletti 231, cited below, is placed here tentatively. It was originally distributed as V. erinoides Lam., then cited by me as V. dissecta Willd. Its leaves have the exact appearance of those of V. dissecta, but its inflorescences are those of V. selloi. It may possibly represent a hybrid between the two species.

Troncoso (1964) says for her V. pulchella var. gracilior: "A typo differt: planta humilior, repens, humifusa; caules ramaeque graciles, ad nodos floriferos radicantes, pubescencia strigosa, sparsa; folia minores." The type of the variety was collected by Arturo Burkart (no. 22380) at Villa Gesell, Gral. Madariaga, Buenos Aires, Argentina, on March 5, 1961, and is deposited in the herbarium of the Instituto Botanico Darwinion at San Isidro. She cites also from Buenos Aires Hicken s.n. [Gral. Pinto, 10-I-1898] (Si), s.n. [Olivos, barrancas, 30-III-1929] (Si), and Nicora 2014 (Si). I have, however, examined an isotype of this taxon in the United States National Herbarium and find it to be identical with typical V. selloi. Shinners (1966) maintains that it is the correct name for what has hitherto passed as V. tenuisepta Briq.

VERBENA SUBINCANA (Troncoso) Shinners, Sida 2: 266. 1966.

Synonymy: Glandularia subincana Troncoso, Darwiniana 13: 478-481, fig. 5. 1964.

Bibliography: Troncoso, Darwiniana 13: 468-470 & 478-481, fig. 5. 1964; Shinners, Sida 2: 266. 1966.

Illustrations: Troncoso, Darwiniana 13: 480, fig. 5. 1964.

Troncoso (1964) describes this species as follows: "Perennis herbacea, circ. 25 cm alt., caulis ad basim prostratis interdum radicantibus, demum ascendentibus, subtetragonis; pubescens apicem versus subincana, ad caules retrorso-hispida, ad bracteas nervis foliorum calycique glandulis patelliformibus intermixta; internodiis 1-5 cm longis; foliis pinnatisectis, 1-4,5 cm longis, subitus crassinervosis, supra et subitus scabro-hirtellis, laciniis circ. 1-2,5 mm latis oblongo-lanceolatis subacutis; capitulis densis solitariis, post anthesin usque ad 7 cm elongatis, pedunculos retrorso-hispido; bracteis lanceolatis ciliolatis hispidulisque, 4-4,5 mm longis, dimidio calyce longioribus, persistentibus; calyce tubuloso 8-8,5 mm longo cano-hispido, dentibus inaequalis usque ad 1 mm longis, corolla violacea 1,2-1,5 cm longa, extus glabra, laciniis obovatis emarginatis, tubo subincurvato apicem versus incrassato; antheris glandulis cylindricis elongatis, exsertis, munitis; stylo 8,5-9 mm longo; fructu 2,5-2,8 mm longo, mericarpis obtusis, dorso-reticulato-sulcatis.....Planta perenne, sufruticosa en la base, con tallos extendidos, rastleros o radicantes en la base, luego erguidos, sin formar césped. Ramas subtetragonas con pubescencia hirsuta, extendida o retrorsa sobre los ángulos, el resto cano-hispido, más densa hacia el ápice dándole un aspecto blanquecino. Entrenudos breves, de 1-3 cm long, más largos hacia el extremo de la ramas, hasta de 5 cm long. Hojas pinnatisectas, con un fascículo de hojitas menores en las axilas, de 1-3 (-4,5) cm long, atenuadas en breve pecíolo, lámina de ámbito oval-triangular, hirsutas en el epífilo con pelitos rígidos, callosos en la base, más densamente en el hipófilo sobre los nervios y el margen subrevoluto (visto en material seco), nervio medio impresio arriba, prominente abajo; lacinias oblongo-lanceoladas, subagudas u obtusas, enteras o dentadas, de 1-1,5 mm lat. Inflorescencia en densas cabezuelas terminales, solitarias, que se alargan en la fructificación hasta 7 cm long, pedúnculo hirsido y cano-hispido con pubescencia retrorsa. Brácteas lanceoladas, subcóncavas

en la base, de 4—4,5 mm long, generalmente superando la 1/2 del cáliz, nervio medio manifiesto, pestafosas, el resto incano-hispídulo, persistentes sobre el raquis después de la fructificación. Cáliz cilíndrico-tubuloso, de 8—8,5 mm long. (incluido los dientes), cano-hispídulo en toda su superficie, más densamente en la 1/2 inferior y con pelitos más rigidos y oblicuos hacia el ápice de la costillas y los dientes, ciliolado en el borde, dientes desiguales, subulados, los mayores de 1 mm long., ensanchados y membranáceos en la base; cáliz fructífero plegado en el ápice por encima de los mericarpios. Brácteas, cáliz y nervios del envés de la hojas con pequeñas glándulas pateliformes. Corola violácea, morada o lila azulada (según los coleccionistas), de 1,2—1,5 cm long., lóbulos obovales, escotados, tenuemente nerviados (sub lente), glabra exteriormente; tubo de 1—1,2 cm long., brevemente encorvado y ampliado en la parte superior. Estambres típicos, los superiores con apéndices anterales cilíndricos, superando las tecas y asomando en la garganta corolar, Gineceo típico, estilo de 8,5—9 mm long. Mericarpios de 2,5—2,8 mm long., recubiertos por el cáliz persistente que a la madurez se hiende lateralmente, cilíndricos, redondeados en el ápice y truncados en la base, ápice y 1/2 superior del dorso alveolado el resto surcado, cara ventral blanco-verrucoso (sublente), pericarpio prolongado por debajo de la parte fértil, no ensanchado. Habita laderas pratenses, en suelos arenosos.....Especie afín a Gl. selloi, de la que se diferencia por su pubescencia cano-hispídula en brácteas, cáliz y pedúnculos, por su corola glabra exteriormente y en general por ser toda ella mucho más hirsuta y no formar céspedes densos. De Gl. pulchella se aparta por la pubescencia, no estrigosa y por los mericarpios menores y redondeados en el ápice, no rostrados." She cites from Entre Ríos, Argentina, Burkart 25425 (Si) and from Uruguay Rosengurtt & al. 492 (Si) and PE.5262 (Si).

The type of the species was collected by Bernardo Rosengurtt Gurvich (no. B.992), common in riverside thickets at Arroyo Valentín, Río Arapey, dept. Salto, Uruguay, on January 28, 1937, and is deposited in the herbarium of the Instituto Botánica Darwinion at San Isidro, Argentina. This collection was cited by me in previous works as V. pulchella Sweet.

Collectors describe V. subincana as prostrate or ascending, stoloniferous, the corollas varying from lilac or violet to purple. They have found it growing in riverside thickets, rocky fields, and low or dry rocky sunny sandy campos, as well as on grassy slopes, at 150 meters altitude, flowering in September, October, January, and February. Rambo says "Species in toto planalto, praesertim in rupestribus valde communis" in Rio Grande do Sul, Brazil. The flowers are described as "lilac" on Rosengurtt B.992, "violet" on Herter 181g, and "purple" on Rosengurtt B.3756 and Gallinal, Aragone, Bergalli, Campal, & Rosengurtt PE.5262.

The Brade 7000, Gallinal, Aragone, Bergalli, Campal, & Rosengurtt PE.5262, Løfgren s.n. [22-9-1887; Herb. Com. Geogr. e Geol.

3685; Herb. Inst. Bot. S. Paulo 15725], Rambo 10103, and Rosen-  
gurtt B.3756, cited below, were previously cited erroneously by  
me as V. dissecta Willd., while J. T. Lima s.n. [II.1946; Herb.  
Rio de Jan. 55466] was erroneously cited by me as V. pulchella  
Sweet.

Additional illustrations: Troncoso, Darwiniana 13: 472, fig. 1.

1964.

Smith and his collaborators found this plant growing in dry open ground and on rock outcrops, as well as in bogs, in Santa Catarina.

Rambo (1965) cites Herb. Anchieta 9389, 9913, 10005, 10103, 25789, 34719, 28352, 53317, 60504 [Sacco s.n.], 61292 [Pivetta 1155], 61443 [Sacco 646], 61444 [Sacco 647], 63207 [Spies s.n.], and 63244 [Spies s.n.] from Rio Grande do Sul, Brazil, all collected by himself except where otherwise noted. He describes the species as "Prostrate, base generally a little elevated branches radiating, up to 40 cm long", growing in "Dry, more or less open to grassy Campos" in the "Western to central Campos area, absent from the northeastern quadrant" in Rio Grande do Sul, with a general distribution "From Rio de Janeiro to Uruguay and northern Argentina".

Troncoso (1964) describes the species as follows: "Herbácea perenne, sufruticosa en la base, rastrera, muy extendida, con ramas floríferas ascendentes, subglabra a ralamente estrigoso-pubescente más densa en la región de la inflorescencia. Ramas delgadas, subcilíndricas, entrenudos de 2--3 cm long. Hojas pinnatisecta, de ámbito triangular, de 1,5--3 cm long., con un fascículo de hojitas menores o ramitas abreviadas en las axilas, lacinias filiformes de 0,5--1 mm diá., por lo general enteras, subagudas, subrectas (incurvadas en el material seco), glabrescentes o con pelitos estrigosos ralos en ambas caras, nervio medio único inconspicuo en el epífilo, bordes extendidos, a veces en el material de herbario parecen subrecurvos. Inflorescencia en cabezuelas terminales solitarias, pedunculadas, especiformes, en la fructificación hasta de 7 cm long. Brácteas ovales u oval-lanceoladas de 2--3,5 mm long., con nervio medio visible, subcóncavas en la base, estrigosas. Cáliz cilíndrico, de 9,5--9 mm long. (incluidos los dientes), densamente estrigoso-pubescente en toda su superficie, dientes desiguales subulados, subrectos, los mayores de 1 mm long., conniventos o contortos en el cáliz frutífero. Brácteas y cáliz con glandulitas pateliformes, subsésiles, Corola glabra exteriormente, tubo de 12--13 mm long. Estambres típicos, los superiores con apéndices anterales cilíndricos sobre pasando las tecas y exertos. Pistilo típico, estilo filiforme, de 10,5--11 mm long. Mericarpios cilíndricos, de 4,7--5,5 (-6,5) mm long., notablemente rostrados, rostro liso, dorso pardo negruzco, alveolado-estriado, cara ventral blanco-verrucosa, pericarpio dorsal prolongado y ensanchado en la base."

She notes "Habita principalmente en terrenos arenosos.... Especie muy vecina de Gl. pulchella var. pulchella, pero ésta se diferencia por las lacinias de las hojas más anchas, toda la planta más densamente pubescente, mericarpios menores y con rostro reducido y en general por su hábito mucho más robusto y sus tallos apoyantes, radicantes sólo en la base.... Destaco que Grisebach en Symb. ad Flor. Argent. p. 277. 1879, al citar la especie para E. Ríos, Urug-Bonar. señala: 'verae speciei folii segmenta angustissima (1/3 lin. fere lata), glabriuscula, corolla longius exserta et

*caulis suffruticosus*". Los ejemplares uruguayos estudiados se hallan determinados por el Dr. C. Osten y coinciden exactamente con el concepto de Grisebach." She cites: ARGENTINA: Entre Ríos: Burkart 23094 (Si), 3616 (Si); Herb. Inst. Darwin. 12174 (Si); Lorentz 1483 (Bf); Ragonese & Martinez Crovetto 49 (Ib, Si), 5006 (Si); Rivas s.n. [Holt, 15-XI-1924] (Ib-77616). URUGUAY: Berro s.n. [Mercedes] (Ug); Millot s.n. [Herb. Rosengurtt]; Osten 16546 (Ug).

She proposes the following key to distinguish this species from its relatives:

1. Pubescencia estrigosa rala o densa en tallos, hojas, cáliz y brácteas; pedúnculos con pelos aplicados, acroscópicos; cáliz estrigoso o cano-estrigoso en toda su superficie.
2. Dientes del cáliz subulados o apiculados, ensanchados en la base, rectos o subrectos; apéndices anterales exertos, superando las tecas; mericarpios de ápice rostrado o subrostrado y base dorsal del pericarpio ensanchada.
3. Segmentos de las hojas filiformes, de 0,5--1 mm lat., subglabros, bordes extendidos; brácteas ovales u oval-lanceoladas, de 1/3--1/4 la longitud del cáliz, rara vez mayores; mericarpios de 4,5--5,5 (-6,5) mm long., largamente rostrados.....V. tenera.
- 3a. Segmentos de las hojas linear-lanceolados, de 1--2 mm lat., más densamente estrigosos, borde revoluto o subrevoluto; brácteas lanceoladas, igualando o superando da 1/2 del cáliz; mericarpios de 3,5--4 mm long., brevemente rostrados.....V. pulchella.
- 2a. Dientes del cáliz setoso-filiformes, recurvos, sub-truncados en la base; apéndices anterales inclusos, no superando las tecas; mericarpios redondeados en el ápice, pericarpio no ensanchado en la base.....V. tenuisecta.
- la. Pubescencia hirsuta en tallos, hojas, cáliz y brácteas; pedúnculos con pelos extendidos o más comúnmente retrorsos, basiscópicos; cáliz hirsuto sobre las costillas, el resto subglabro o cano-hispídulo.
4. Inflorescencia en cabezuela solitaria; tubo corolar glabro exteriormente; cáliz y brácteas cano-hispídulas, con pelitos más rigidos sobre las costillas del cáliz.V. subincana.
- 4a. Inflorescencia en 2 ó 3 cabezuelas terminales, o cimosa-paniculada; tubo corolar pubescente exteriormente; cáliz y brácteas hirsutas.
5. Cabezuelas 2 ó 3 terminales, rara vez solitarias, alargándose después de la antesis; brácteas lanceoladas, largamente subuladas.....V. selloi.
- 5a. Cabezuelas cimosa-paniculadas, inflorescencia 2 ó 3 veces tricótoma, corimbiforme; cabezuelas no alargándose después de la antesis; brácteas ovales, agudas..V. dissecta.

It is very probable that most of the Uruguayan material cited by me previously as V. tenera actually represents V. selloi according to this revision made by Troncoso. Burkart 22380, which I

cited previously as V. tenera, is the type collection of V. pulchella var. gracilior (Troncoso) Shinners, but this I regard as a synonym of V. selloi Spreng. Burkart 3616, which she cites as V. tenera, I have previously cited as V. tenuisepta Briq.

The flowers are described as "blue" on Schreiter 1904. The Moreno s.n. [Patagon. 1882/4], Schreiter 1904, Tweedie s.n., and Wilkes Exped. s.n., cited below, were previously erroneously cited by me as V. dissecta Willd., while Carette s.n. [Monte Hermoso, 1916] was previously cited by me in error as V. microphylla H.B.K.

On the other hand, the Boffa 25 and Commerson s.n. [Buenos Ayres et Monte Video], previously cited by me as V. tenera, are actually V. dissecta Willd.; A. Castellanos s.n. [23.I.1947; Herb. Inst. Miguel Lillo 15120] is V. mendocina R. A. Phil.; A. T. Hunziker 6471 and T. Meyer 2409 are V. microphylla H.B.K.; Herb. Inst. Miguel Lillo 31472, Jørgensen 1737, and Ruiz Leal 7092 are V. parodii (Covas & Schnack) Moldenke; A. T. Hunziker 5160 is V. pogostoma Klotzsch; H. M. Smith 5 is V. pulchella Sweet; H. H. Bartlett 20821, Berro 134, 4323, 4752, 4753, 4754, 6720, 6800, 8205, 8219, 8390, 8701, 8702, & 8775, Burkart 22380, A. Castellanos s.n. [1.XI.1946], s.n. [26.XII.1946], s.n. [18.I.1947], s.n. [7.XII.1947], & s.n. [9.XII.1947], Felippone 5915, Gallinal, Aragone, Bergalli, Campal, & Rosengurtt 2299, Garolera & Romero s.n. [Cuesta del Obispo, 8.I.1947], Herb. Inst. Miguel Lillo 11755, 11760, 11766, 11768, 15138, 15774, & 32795, Herb. Herter 79174, 79227, & 96600, Herb. Hort. Bot. Petrop. s.n., Herter 181c & 181i, Herter & Strahl 181, Krapovickas 2752, Legrand 2717, Moldenke & Legrand s.n. [Herb. Legrand 2791], Moldenke & Moldenke 19692 & 19696, Edw. Palmer s.n. [La Plata Exped. Capt. Page], Rambo 34719, A. Saint-Hilaire C2.1882, Schreiter 6643, H. M. Smith 140, Swallen 7391, and Teague s.n. [22.II.1947] are V. selloi Spreng.; and A. T. Hunziker 3333 and Malme 348 are V. tenuisepta Briq. The Gallinal, Aragone, Bergalli, Campal, & Rosengurtt 1433 & 1821 and Rosengurtt B.2116, originally distributed as V. tenera and cited by me previously as V. dissecta Willd., are actually V. selloi Spreng.

## VERBENA TENUISECTA Briq.

Additional synonymy: Verbena tenuisecta Brig., in herb. Verbena tenuisecta Brig., in herb.

Additional bibliography: Moldenke, Biol. Abstr. 36: 719. 1961; Hocking, Excerpt. Bot. A5: 44. 1962; Sharp & Baker, Castanea 29: 183. 1964; Troncoso, Darwiniana 13: 468-470 & 477-478, fig. 4. 1964; Moldenke, Phytologia 11: 448, 481, 485, & 486. 1965; Neal, In Gard. Hawaii, new rev. ed., 722. 1965; Hocking, Excerpt. Bot. A9: 366. 1965; Rambo, Pesquis. Bot. 21: 58. 1965; Moldenke, Résumé Suppl. 12: 1, 2, & 13 (1965) and 13: 6. 1966; Shinners, Sida 2: 266. 1966.

Additional illustrations: Troncoso, Darwiniana 13: 477, fig. 4. 1964.

Recent collectors have found this plant growing in black clay, sandy loam, calcareous marl, and in fine sandy silt. Godfrey reports it "abundantly naturalized along roadsides" in North Carolina.

Troncoso (1964) describes this species as follows: "Hierba perenne, rastreira, de ramas extendidas, radicantes, las extremidades floríferas ascendentes, cilíndricas a subtetragónas, glabrescentes o pilosísculas, más densamente pubescentes hacia el ápice. Entrenudos breves, de 1,5-3 cm long. Hojas pinnatisectas, con fascículos de hojas menores en las axilas, lámina de ámbito triangular, atenuada en pecíolo, de 2-3 cm long., lacinias lineares, subrectas, subagudas, enteras o dentadas, margen extendido a subrevoluto (en material seco), impresas en el epífilo, con un nervio central prominente en el hipófilo, estrigosas en el haz y sobre el nervio medio en el envés, el resto glabrescente. Inflorescencia terminal, en cabezuelas solitarias, capituliformes en el floración, alargándose luego en densas espigas, hasta de 8 cm en la fructificación. Brácteas oval-lanceoladas, subuladas, de 3-3,5 mm long., estrigosas. Cáliz cilíndrico, de 8-9 mm long (incluidos los dientes), densamente cano-estrigoso, con pocas glándulas pateliformes, subsésiles; dientes súbitamente setoso-filiformes, desiguales, los mayores de 2-3 mm long., generalmente recurvos. Corola glabra, tubo de 11-12 mm long., garganta ciliada. Estambres típicos, los superiores con apéndices anterales reducidos, no superando las tecas ni la garganta corolar. Gineceo típico, de 0,9-1 cm long. Mericarpios pardonegruzcos, cilíndricos, de 2,5,3 mm long., redondeados en el ápice, truncados, no o apenas ensanchados en la base, ápice y dorso reticulado en la mitad superior, el resto estriado, cara ventral blanco-verrucosa o sublisa. Área: Paraguay y NE argentino.....Especie muy vecina por su hábito de G. pulchella y G. tenera, de las que se diferencia por los dientes del cáliz, setoso-filiformes, de base subtruncada y por los mericarpios más pequeños, de ápice redondeado, no rostrado." She cites from Paraguay Hassler 1603 (Si), Jørgensen 3771, and T. Rojas 2528 (Si) & 2536 (Si).

Shinners (1966) maintains that the correct name for this taxon is V. pulchella var. gracilior (Troncoso) Shinners, but this name

belongs in the synonymy of V. selloi Spreng.

The Burkart 3616, cited by me previously as V. tenuisepta, is regarded by Troncoso (1964) as representing V. tenera Spreng. instead.

Recent collectors have found V. tenuisepta growing in dry or somewhat moist sandy rather open places in Rio Grande do Sul, Brazil. The flowers are described as "violet" on A. T. Hunziker 3333. This collection and Malme 348, cited below, were previously erroneously cited by me as V. tenera Spreng. Material of V. tenuisepta has been misidentified and distributed in herbaria as V. ciliata Benth.

**VERBENA WRIGHTII A. Gray**

Additional bibliography: Hocking, Excerpt. Bot. A9: 367. 1965; Moldenke, Phytologia 11: 437, 440, 452, & 486--497. 1965.

In Nuevo León, Mexico, this plant has been found growing in calcareous marl, while Warnock says that it is "frequent" in limestone soil in Texas. Other recent collectors have found it along sandy rocky washes, in sandy gravel, on granite schist, and in dry sandy soil near creeks. The flowers on J. R. Crutchfield 107 & 319 are described as "pink". On Beasley & Finzel 805 they were "violet-pink" and on Crutchfield 63 "purple".

**VERBENA WRIGHTII f. ALBIFLORA Moldenke**

Additional bibliography: Hocking, Excerpt. Bot. A9: 367. 1965; Moldenke, Phytologia 11: 491 & 497--498. 1965.

**VERBENA XUTHA Lehm.**

Emended synonymy: *Verbena matthesii* Turcz., Bull. Soc. Nat. Mosc. 36 (2): 196--197. 1863.

Additional and emended bibliography: Turcz., Bull. Soc. Nat. Mosc. 36 (2): 196--197. 1863; Hocking, Excerpt. Bot. A9: 367. 1965; Moldenke, Phytologia 11: 446 & 498--507. 1965.

Turczanow (1863) describes his *V. matthesii* as follows: "V. caule fruticoso tetragono, paniculato-ramoso, pilis adpressis aut subpatentibus scabro, ramis ramulisque oppositis, apice 1--3-stachyis; spicis inferne laxis, superne densifloris filiformibus elongatis; foliis basi breviter cuneata sessilibus oblongis acutis inciso-serratis; serraturis subfalcatis acuminatis, interioribus intertum bifidis aut denticulo auctis, utrinque pubescentibus; bracteis lanceolato-subulatis calyce pubescente brevioribus; tubo corollae calycem parum excedente; nuculis transverse rugosis. Ad *V. menthaefoliam* Bth., e hujus descriptione, videtur accedere; at bracteae non parvae, sed calyce paulo breviores, corolla calyce paulo nec triplo major."

Additional citations: TEXAS: Brazos Co.: Demaree 50859 (Ac); Fayette Co.: Matthes 13 [Macbride photos 34343] (W--photo). Galveston Co.: R. L. Crockett 8462 (Ld).

Moldenke, Harold N. 1966. "Additional notes on the genus Verbena. II." *Phytologia* 13, 243–276.
