

June 28, 1842.

William Yarrell, Esq., Vice-President, in the Chair.

A Monograph on the Coleopterous family *Phyllophoridae*, by the Rev. F. W. Hope, was read. Following are the characters of the new species and genera contained in this paper.

Family *PHYLLOPHORIDÆ*, Hope.

Genus *Phyllophorus*, Hope.

Fœmina antennis filiformibus 11-articulatis, articulo 1^{mo} magno, externè crassiore, duobus proximis brevibus, 7 sequentibus gradatim increscentibus et ferè trigonis, ultimo autem ovale, apice parum minori. *Palpi* haud securiformes. *Caput* impressum, maxillis obtusis unidentatis. *Thorax* lateribus carinatis, angulis posticis subspinosis, anticis subrotundatis. *Elytra* thorace quintuplo longiora, sulcata et rugosa, lateribus elevatis.

Phyllophorus gigas. *Elater gigas*, Fab., Syst. Eleut.

Genus *Tetralobus*, Serville.

Tetralobus flabellicornis. *Elater flabellicornis*, Fab.

Tetralobus cinereus, Gory, Ann. de la Soc. Ent. de France, tom. i. p. 220. pl. 4. fig. 1.

TETRALOBUS GORYI. *Tetr. Mas, fusco-cinereus, capite ferè quadrato, anticè subexcavato, angulis anterioribus rotundatis. Thorax marginatus, valde convexus, ad scutellum elevatus, utrinque depresso, angulis posticis obliquè acutis. Elytra thorace triplo longiora, posticè rotundata, lineis elevatis parum distinctis, tomentosa. Corpus infrà piceo-cinereum, pectore pubescens. Pedes tomentosi, femoribus compressis, tibiis subarcuatis, tarsisque membranaceis. Annuli abdominis utrinque foveolati.* Long. corp. 18½ lin.; lat. 5½ lin.

Hab. forsitan in Africâ.

Fœmina differt, long. 21 lin., lat. 6 lin.; antennis serratis, articulo ultimo tribus antecedentibus æquali, subacuto, ab domine multo convxiore.

A small variety of the above species exists in the rich cabinet of M. Dupont at Paris, and has been named by him *T. Sennarius*. It measures twenty lines in length, and differs also in the colour of its pubescence.

TETRALOBUS DUPONTI. *Tetr. nigro-cinereus, capite ferè quadrato, anticè excavato, tomentoso, angulis anticis rotundatis. Thorax convexus, subtilissime punctulatus haud foveis binis in medio im-*

pressus. Elytra thorace triplo longiora, ad suturam subacuminata, lineis vix distinctis. Corpus infrà piceum, tomentosum, binis ultimis annulis foveis, utrinque fortiter impressis. Pedes, femoribus, tibiisque compressis. Long. corp. 28 lin.; lat. 9 lin.

In Musæo Dom. Dupont.

It is probable that the above species is from Africa. It was received by Mr. Dupont (in whose honour it is named) from a foreign traveller, who is lately dead. No locality is mentioned. The antennæ are imperfect.

TETRALOBUS SAVAGEI. *Tetr. totum corpus suprà fusco-brunneum, aurantiisque capillis obsitum. Caput ferè quadratum, angulis anticis rotundatis, anticè excavatum. Thorax convexus, angulis posticis acutis. Elytra thorace duplo longiora, auratâque pubescentiâ tecta. Corpus infrà abdomine piceo, pectore aurantiis capillis longis ob-sito, femoribus tibiis piceis tarsisque infrà auricomatis.* Long. corp. 13 lin.; lat. 4 lin.

The above species I have much satisfaction in naming after an American clergyman, the Rev. T. S. Savage. His zeal in the collecting of insects in Western Africa has tended to add greatly to our stock of information regarding the entomology of those countries. Respecting the Goliath Beetles, he has in store for us many important observations, having collected them in the bush: his remarks on them may shortly be expected to arrive in this country.

Tetralobus Australasiæ. Gory, Ann. de la Soc. Ent. de France.

TETRALOBUS FORTNUMI. *Tetr. totum corpus fuscum, auratâ pubes-centiâ tectum, antennisque pedibus ferrugineis, elytrisque suturâ acuminatis. Caput vix emarginatum punctatum, fronte foveâ anticè impressâ. Antennæ ferrugineæ. Fasciculus antennarum e lamellis novem rubro-ferrugineis. Thorax angulis anticis lateralibus, porrectis rotundatis; posticis acutis, disco varioloso-punctato, lineâque longitudinali parum impressâ. Scutellum posticè rotundatum. Elytra striato-punctata, striis punctis fortiter impressis, interne acuminata, externèque rotundata. Corpus infrâ atro-piceum aureo tomentosum, capillis pectoris longioribus. Pedes ferruginei, tarsis subtûs pallidioribus et excavatis.* Long. corp. 12 lin.; lat. 3 lin.

The above insect was lately sent to this country by Mr. Fortnum, from the new settlement of Adelaide, and although closely allied to *T. Australasiæ* of Gory, is yet distinct; it is the smallest species that has fallen under my notice, and has been named in honour of the above assiduous collector.

TETRALOBUS PARRYI. *Tetr. niger, capite ferè quadrato, antrorsum foveolato, angulis anticis parum rotundatis. Oculis flavis. Thorax latus punctulatus. Elytra thorace triplo longiora, depresso-striata, striis valdè distinctis. Corpus infrâ nigrum, segmentis abdominis utrinque foveolatis, pedibus piceis, antennis ferrugineis.* Long. corp. 18 lin.; lat. $6\frac{1}{4}$ lin.

Hab. in Nubiâ. In Musæo Dom. Parry.

Captain Frederick Parry lately received this species in a box with

other Nubian insects. It is of a remarkably depressed form, approaching somewhat in this respect to *Tetralobus Goryi*, which latter insect, however, is certainly much more convex, and differs from it also in various other minor points.

TETRALOBUS MANGLESII. *Fœm. fusco-picea, antennis articulo primo concolore, reliquis ferrugineis. Caput ferè quadratum, punctatum, oculis rubris et nitidis. Thorax valdè convexus, angulis anticis rotundatis, posticis acutis, linea longitudinali media, fovea utrinque compressa insignitus. Elytra vix acuminata, striato-punctata. Corpus infrà rubro-piceum, antennis tarsisque ferrugineis.* Long. corp. 17 lin.; lat. $4\frac{1}{4}$ lin.

Hab. in Novâ Hollandiâ.

The above insect was sent to me by Capt. Mangles, the Egyptian traveller, in whose honour it is named. He received it from the vicinity of the Swan River.

Since the above was written, I have discovered the male in the collection of the Linnean Society, and the following is a concise description of it:—

Fusco-piceus, articulo primo nigranti, reliquis ferrugineo flabellatis. Caput ferè quadratum, vix emarginatum. Thorax convexus, marginibus lateralibus subcarinatus. Scutellum valdè depresso. Elytra acuminata, substriato-punctata et sparsim punctulata. Corpus infrà fusco-piceum, pectore auratâ pubescentiâ tecto, pedibus ferrugineis et auricomatis.

TETRALOBUS AURICOMUS. *Tetr. aureo-tomentosus, antennis flabellatis nigris, thorace posticè producto, elytris thorace triplo longioribus, auricomatis, apicibus rotundatis. Corpus infrà aureo-tomentosum, pedibus concoloribus. Caput anticè rotundatum, fronte subfoveolatâ. Antennæ articulo 1^{mo} inæquali elongato subsecuriformi, 2^{da} et 3^{tio} minutis, reliquis trigono-ramosis, ultimo sublongo compresso, apice emarginato. Thorax anticè rotundatus, convexus, in medio disci foveda utrinque impressâ, angulisque posticis acutis. Elytra auricomata vix sublineata. Corpus infrà tomentosum, annulis abdominis utrinque subimpressis.* Long. corp. 12 lin.; lat. $3\frac{3}{4}$ lin.

In Musæo Dom. Guerin.

Hab. in Africâ.

Since the above description was written a more exact locality has been given me.

Hab. "Le fort de Sedou, au bord de la rivière Casamance, découvert par M. le Capitaine Mion."

TETRALOBUS ROBUSTUS. *Fœm. flavo-fusca, antennis valdè compressis. Caput anticè excavatum, flavisque capillis obsitum. Thorax convexus, angulis anticis rotundatis, posticis acutis. Elytra striata, ad apicem dehiscentia, subacuta. Corpus infrà flavo-fuscum, pectore aurato tomento obsito pedibus concoloribus.*

From the remarkable compressed antennæ I am inclined to consider this insect, which was received from the island of Madagascar,

as the type of a distinct genus. The following characters may be deemed sufficient to mark its peculiarities, which are chiefly taken from the antennæ, and hence it has been named

*Piezophyllum**.

Caput rotundatum, antepnis valdè compressis, undecim articulatis, articulo 1^{mo} crasso, 2^{do} brevi, octo sequentibus gradatim decrescentibus, ultimo apice acuto. Thorax angulis anticis rotundatis, posticis acutis. Elytra subacuminata e suturâ dehiscentia lateribus medio subsinuatis. Pedes robusti, tibiis subincurvis.

Other peculiarities might be mentioned; but as it is well-figured, however, its other characters may easily be distinguished.

PIEZOPHYLLUS SHUCKARDI. *Tetr. atro-piceus, capite ferè quadrato, anticè parum excavato, angulis anticis subobliquè truncatis antennisque ferrugineis. Antennæ articulo 1^{mo} ferè trigono, crasso, 2^{do} 3^{tiō} brevibus, 7 sequentibus lamelligeris; antennis capite thoraceque æqualibus. Thorax valdè convexus, lateribus carinulâ insignitis, angulisque posticis subacutis. Elytra sulcata. Corpus infrà atro-piceum, pectore hirsuto, flavisque capillis longis obsito. Pedes picei, auricomî, femoribus tibiisque subcompressis. Long. corp. 24 lin.; lat. 7 lin. ♀ Long. corp. 21 lin.; lat. 7 lin.*

I am indebted to Mr. Shuckhard for the above insect, and the species is most probably the *Tetralobus Dumolinii* of Dupont's cabinet. The antennæ and tarsi of this specimen were in too imperfect a state to describe.

PIEZOPHYLLUS SPENCEI. *Tetr. niger, antennis fusco-piceis, articulo primo nigricante. Caput ferè quadratum, anticè excavatum. Thorax robustus, valdè convexus, linea longitudinali impressâ foveâque utrinque insignitus et crebrissimè punctulatus, angulis posticis ferè rectis et acutis, carinulâ abruptè interruptd. Elytra ad apicem dehiscentia, subacuta. Corpus infrà atrum, pectore auricomato pedibusque concoloribus. Long. corp. 16 lin.*

Hab. in agro Senegalensi.

This singular insect is described from the rich cabinet of Monsieur Dupont in Paris, and it appears to belong to the same subgenus as *Tetr. Shuckardi*. The same insect I have seen before, and as it was named after Mr. Spence, the celebrated entomologist, I have retained that name.

Oxynopterus† mucronatus. Elater mucronatus, Olivier.

Olivier suspects that this insect is the female figured by Voet (vid. Coleop. tab. 45. fig. 34.) ; it was originally described from the cabinet of the Prince of Orange, and certainly differs from the *Flabellicornis* of Drury, which Olivier seems to doubt. The following short Latin characters separate it at once from *Tetralobus*.

* Piezophyllum, from πιέζω premo, et φύλλον folium.

Genus *Oxynopterus*^{*}, Hope.

Caput anticè subemarginatum, antennis ♂ apicibus flabellatis elytrisque in utroque sexu acuminatis. *Thorax* angulis anticis ferè rotundatis, posticis acutis. *Elytra* striata et mucronata, pedibus veluti in Tetralobo.

Each joint of all the tarsi is clothed beneath with a row of short golden-coloured plush, as in other species belonging to this genus.

OXYNOPTERUS AUDOUINI. *Oxyn.*, *Mas*, brunneo-cinereus, capite fortiter excavato, parum tomentoso. *Thorax* emarginatus, posticè subsinuatus, anticè aurantiis capillis obsitus, depresso. *Scutellum* rotundatum. *Elytra* brunneo-cinerea, parum tomentosa. *Corpus* infrà nigro-cinereum. *Pedes* concolores, femoribus tibiisque compressis, tarsisque piceis. Long. corp. 62 lin. ; lat. 23 lin.

The above species was described by me, during my late residence in Paris, from the collection at the Jardin des Plantes. It is named in remembrance of the late Professor Audouin, who succeeded to the entomological chair held by the celebrated Latreille. The locality was not stated; I believe it, however, to be from the East Indies, although I cannot actually specify its real locality. It seems to differ considerably from *mucronatus* of Olivier.

OXYNOPTERUS CUMINGII. *Oxyn. fusco-flavus*, antennis ferrugineis.

Caput clypeo rotundato atro, medio disci subsulcato. *Thorax* fuscus, marginibus elevatis, angulis anticis parum productis, posticis acutis et extùs divergentibus. *Scutellum* posticè rotundatum atrum. *Elytra* acuminata fusco-flava, tribus lineis parùm elevatis insignita. *Corpus* infrà atro-piceum, femoribus concoloribus. Mesosternum fortiter excavatum, cornu a prosterni ad medios pedes porrecto. Long. corp. 36 lin. ; lat. 11 lin.

Fœmina magnitudine differt, thorace etiam paullo latiore antennisque compressis.

The light castaneous appearance of the elytra of the above insect must in a great measure be attributed to abrasion: when recently captured it was remarkable no doubt for a golden pubescence above and beneath, which is a characteristic of other allied species. The above magnificent species is named in honour of Mr. Cuming the conchologist, whose important discoveries at Manilla in various branches of zoology entitle him to the thanks of the naturalists of England. It may be mentioned with regard to the above insects, that the joints of all the tarsi are clothed with a row of short golden-coloured plush; the head and thorax are covered also with very short gray pile, and in the male the elytra are fulvous red, whilst in the female they are saturated on the disc with brown; the latter sex is also a quarter of an inch larger than the male. It is also worthy of notice that the joints of the antennæ to which the leaflets are attached gradually increase after the third joint, the extreme being the most marked.

* From ὁξύς, *acuo*, and πτερόν, *penna*.

OXYNOPTERUS LATIPENNIS. *Nigro-fuscus, antennis concoloribus, elytris acuminatis et piceis. Caput ferè quadratum, anticè excavatum rugoso-punctatum. Thorax latus, angulis anticis vix productis, posticis acutis, lateribus marginibus elevatis. Elytra atro-picea tomentosa, apicibus acutis. Corpus infrà nigrum, pedibus ferrugineis.* Long. corp. 24 lin. ; lat. 8 lin.

Hab. in Africâ.

The above species was received by me in a box of insects from the Cape of Good Hope : for some time I was induced to regard it as an Asiatic species, but since I have lately received a species nearly similar in form from Sierra Leone, it may be an African insect. It is remarkably broad for a male ; the disc of the thorax also is slightly convex. A label attached to it has 'Gold Coast' written on it.

In Musæo Dom. Hope.

Fœmina adhuc latet.

OXYNOPTERUS JAVANUS. *Oxyn. fusco-flavus et aureo-tomentosus, antennis ferrugineis. Caput atrum, antennis thorace ferè duplo longioribus. Thorax anticè emarginatus, angulis utrinque productis, posticis acutis et divergentibus. Elytra acuminata fusco-picea aurato-tomentosa. Corpus infrà nigrum, pedibus nigricantibus tomento suprà aspersis, tarsisque auricomatis.* Long. corp. 23 lin. ; lat. 7 lin. ♀ Long. corp. 28 lin. ; lat. 8 $\frac{1}{4}$ lin.

Fœmina differt antennis compresso-serratis et fuscis.

Hub. in insulâ Javæ.

The above insects, male and female, were brought to this country by Dr. Horsfield from the island of Java ; at first I was inclined to consider the species as the *mucronatus* of Olivier, but the figure in Voet is quite different. I have no hesitation in recording it as another species, and it may be remarked here that the above insects are in a good state of preservation, and that all the species of flabellate Elaters with pubescence should be described immediately they are captured, as when dead they change considerably in colouring, often turning black and greasy, so that it is impossible accurately to describe them as in their original state.

LEPTOPHYLLUS STRACHANI. *Lept. (Mas) piceus, capite anticè excavato antennis, capite cum thorace ferè duplo longioribus, elytrisque acuminatis. Caput ferè quadratum, anticè excavatum rugosum, antennæ thorace duplo longiores, lamellis elongatis et ferrugineis. Thorax undique marginibus elevatis conspicuis, angulis anticis parùm productis, obtusis, posticis acutis et extùs divergentibus. Elytra valdè acuminata marginata picea et aurato-tomentosa. Corpus infrà concolor, femoribus tibiisque compressis. Fœmina adhuc latet.* Long. corp. 26 lin. ; lat. 7 lin.

The above species was brought to this country by Mr. Strachan, long time a resident at Sierra Leone. His zeal in urging his friends to collect insects in that climate has been the means of considerably enriching our metropolitan collections, and to him chiefly we are indebted for our acquaintance with the Goliath beetles. I have named

Hope, F. W. 1842. "A monograph on the coleopterous family Phyllophoridae." *Proceedings of the Zoological Society of London* 10, 73–79.
